61	Section 2.4.1 notes the OMF South and OMF North will have greater capacities than the OMF East and OMF Central. What is the impact of other link extensions? This implies OMF North and South will produce greater externalities. Total capacities of the 4 OMFs is 496 LRVs. As OMF South is being built before OMF North, any reduction in footprint as a result of planned capacity exceeding project capacity will fall on OMF South. Section 4.5 should include a table of the link extensions coming online, such as Lynnwood and East, along with OMF capacities to better highlight the need and impacts of regional light rail extensions within Sound Transit 3.	Chapter 1, Purpose and Need for the Project, of the Final EIS discusses Sound Transit's plans for expansion under Sound Transit 3 and the service lines supported by each current and planned OMF. OMF South would be built in the South Corridor to maintain and store a portion of the LRV fleet for the West Seattle/Ballard to Tacoma Dome service as well as to receive, test, commission, store, maintain, and deploy new LRVs for the entire system. Current planning includes at least 144 and up to 160 LRVs stored at OMF South and approximately 150 at OMF North, which would—along with OMF Central and OMF East—meet the total LRV storage needs of ST 3. The cumulative effects of the expansion of the regional transit system were discussed in the Final Supplemental EIS for the Long-Range Plan (Sound Transit 2014).
62	**Attachment** – Supplemental Appendix G1 comments Add description of existing land uses at each site	This comment refers to the Transportation Technical Report. Please see Final EIS Section 3.4, Land Use, for a description of land uses in the study area.
63	Label 21st Ave S on all figures	The suggested revision was made for the 2023 Draft EIS and is reflected in this Final EIS.
64	5 Lanes	Appendix G1, Transportation Technical Report, of the 2023 Draft EIS was revised to address the comment. This update is reflected in this Final EIS.
65	add dashes	Appendix G1, Transportation Technical Report, of the 2023 Draft EIS was revised to address the comment. This update is reflected in this Final EIS.
66	(Per Federal Way) Please differentiate line colors and or styles better. Too many greens. Please differentiate line colors and or styles better. Too many greens and reds. It is impossible to discern route frequencies on this map.	Figures G1.3-15 and G1.3-16 were updated in Appendix G1, Transportation Technical Report, of the 2023 Draft EIS for clarity. Route frequencies are listed in detail in Table G1.3-14 (Study Areas Transit Service). These updates are reflected in the Final EIS.
67	Bicycle Lanes	The figures were updated for the 2023 Draft EIS to reflect the current bicycle and pedestrian facilities at the time of publication. These updates are reflected in this Final EIS.
68	Is this the correct intersection? Should this be 16th Ave S Collision rates should be provided per city of Federal Way TIA guidelines to identify potential inadequacies, defined as: -A collision rate of more than 1 collision per million entering vehicles at an intersections -A collision rate of more than 10 collisions per million vehicle miles on a roadway segment It's both - the west leg is S 340th Pl	The intersection labels have been updated to reflect the street names on the east side of SR 99. For the safety analysis, each OMF South alternative was analyzed using the same type of data and methodology to allow for equal comparison among alternatives. The 2023 Draft EIS was updated with an analysis of crash data that uses the city of Federal Way's approved methodology. These updates are reflected in the Final EIS.

City of Federal Way (Communication ID 472867)

Comment ID	Comment Text	Response
69	Collision rates should be provided per city of Federal Way TIA guidelines to identify potential inadequacies, defined as: -A collision rate of more than 1 collision per million entering vehicles at an intersection	Each OMF South alternative was analyzed using the same type of data and methodology to allow for an equal comparison among alternatives. The 2023 Draft EIS was updated with an analysis of crash data that uses the city of Federal Way's approved methodology. This update is reflected in the Final EIS.
70	HOV, not BAT	This correction was made to the 2023 Draft EIS and is reflected in the Final EIS.
71	Please provide context for why PM peak hour delay at Intersection #2 decreases from existing to 2042 no-build conditions (changes in PHFs, signal timings, etc?)	Existing conditions were modeled using existing timing card inputs, while the future conditions were modeled using the optimization function within Synchro. The results are similar, indicating that improvements in signal timing could allow some growth in traffic volume while maintaining similar traffic operations. The improvement of intersection operations due to signal optimization is noted in Section 3.2.2.1 of the 2023 Draft EIS and this Final EIS.
72	SB volumes incorrect	The figure from Appendix G1, Transportation Technical Report, was revised to make the correction for the southbound volumes at the SR 99 and S 340th Street intersection in the 2023 Draft EIS. This update is reflected in the Final EIS.
73	Actually, it's out to bid right now.	The 2023 Draft EIS was updated to describe the current and planned bicycle and pedestrian facilities, including those developed since the release of the 2021 Draft EIS. The description of current planned and constructed bicycle and pedestrian facilities has been further updated in this Final EIS. See Section 3.2, Transportation.
74	Please elaborate on trip distribution methodology. Why weren't other sources used (such as local transportation models or census data) A separate trip generation section should be included that provides more detail on methodology. Per the Sound Transit (2020a) report, in addition to employee-related trips, the trip generation should take into account site-related deliveries and existing site uses that will be removed as a result of the project. It is also unclear how the information included in the Sound Transit (2020b) report led to the auto volumes outlined in Table G1.4-7. For example, why would there be so few departures in the AM when the graveyard shift ends right before the AM peak hour begins?	This Final EIS includes a more detailed discussion on trip generation and distribution methodology. See Section 3.2, Transportation, of the Final EIS, and Section 3.2.2.2 in Appendix G1, Transportation Technical Report.
75	Please provide clarification: 450 spaces of 427 spaces?	This was an error between the number of spaces reported in Table G1.4-9 and the text. The number of estimated parking spaces was updated to 480 in the 2023 Draft EIS. This update is reflected in this Final EIS.

City of Federal Way (Communication ID 472867)		
Comment ID	**Comment Text**	**Response**
76	Why would this be the case of some no-build improvements are not feasible with projects?	OMF South would include improvements for both motorized and nonmotorized users. Section 4.2.2.6 of the 2023 Draft EIS and this Final EIS describes the bicycle and pedestrian facilities that would be implemented as part of the Preferred Alternative. Section 4.2.3.6 notes that if the South 344th Street Alternative were to be selected as the project to be built, Sound Transit would evaluate options for replacing the function of the greenway between S 336th Street and S 344th Street.
77	The closure of 20th Ave S needs to be adequately analyzed. As currently analyzed, existing traffic utilizing the portion of 20th Ave S is not removed and rerouted to other roadways. While this is true, it would impact the usefulness of the 20th Ave extension and limit potential plans for non-motorized connections Closure needs to be evaluated as a Comp Plan amendment, as 20th Avenue S is shown therein as would eliminate an alternative route to SR 99 for failing to meet block perimeter requirements. Impacts to emergency response also need to be addressed. This is also true for the S 344th Alternative. Approval is in no way assured, but realignment may be considered.	As described in Chapter 2, Alternatives Considered, of the 2023 Draft EIS and this Final EIS, after publication of the 2021 Draft EIS, Sound Transit refined the design of the Preferred Alternative to extend 18th Place S to replace the functions of a vacated 20th Avenue S. This Final EIS includes an updated transportation impact analysis that reflects the updated design in Section 3.2, Transportation. Please also see Section 3.4.2, Consistency with Regional and Local Comprehensive Plans and Zoning.
78	This figure should include trip distribution percentages on the map, or separate trip distribution figures should be provided.	The Final EIS includes a more detailed discussion on trip generation and distribution methodology. See Section 3.2, Transportation, and Section 3.2.2.2 in Appendix G1, Transportation Technical Report. The analysis uses actual traffic volumes, not trip distribution percentages, to provide the necessary data.
79	20th Ave S of 336th Street will be closed as part of this project. Existing trips entering and exiting need to be removed and rerouted in order to adequately analyze the impacts of the roadway closure. Some intersections (Intersection #2 in particular) may be impacted by the closure of 20th Ave S. Additional analysis should be provided.	The traffic operations analysis in the Final EIS has been updated to account for the closure of 20th Avenue S between S 336th Street and S 341st Place, the addition of the 18th Place S extension between S 336th Street and S 340th Street, and the extension of 21st Avenue S to S 344th Street.
80	What would these bike lanes connect to? Clarify: Would this be implemented as part of the project?	Section 4.2.2.6 of Appendix G1, Transportation Technical Report, was updated in the 2023 Draft EIS to include more information regarding bike lanes. The extension of 18th Place S includes bicycle lanes. This update is reflected in this Final EIS.

City of Federal Way (Communication ID 472867)		
Comment ID	**Comment Text**	**Response**
81	Given that the proposed project does not generate significant trips during the weekday AM and PM peak hours either, is it possible that the two uses will have overlapping peaks at other times? Do the roadway network changes impact the church or other existing uses? For trips removed from intersection #6: volumes should either be: (1) rerouted to other intersections in the network, or (2) if to be removed completely, trips should be removed at other intersections as well and justification should be provided as to why those trips will be removed from the network.	The analysis focuses on impacts during the time periods of highest existing traffic in the study area (AM and PM peak hours). This represents worst-case conditions along the roadway network to determine the impacts of adding more trips from a new development. This is common methodology for traffic impact analyses. There are other times during the day when the proposed OMF South would have higher inbound and outbound volumes than during the AM and PM peak hours. The text in the 2023 Draft EIS was updated to reflect this. The traffic operations analysis in the Final EIS was further updated to account for roadway closures, including redistribution of traffic to and from the Christian Faith Center and other remaining properties that are served by 20th Avenue S.
82	Provide additional detail regarding the function of 20th Ave S under this scenario. Who will be able to use it and at what times? Will the existing church still have access? This figure should include trip distribution percentages on the map, or separate trip distribution figures should be provided.	The 2023 Draft EIS was updated to clarify that 20th Avenue S would serve as public access to the Christian Faith Center property. The analysis uses actual traffic volumes, not trip distribution percentages. This update is reflected in the Final EIS.
83	For trips removed from intersection #6: volumes should either be: (1) rerouted to other intersections in the network, or (2) if to be removed completely, trips should be removed at other intersections as well and justification should be provided as to why those trips will be removed from the network. 20th Ave S of 336th Street will be limited in access as part of the project. Existing trips entering and exiting need to be removed and rerouted in order to adequately analyze the impacts of the roadway closure.	Please see response to Comment ID 79.
84	Some intersections (Intersection #2 in particular) may be impacted by changes to the roadway network. Additional analysis should be provided.	The traffic operations analysis was updated in the 2023 Draft EIS and again for this Final EIS to account for removal of existing trips from parcels being acquired and rerouting of any remaining trips due to roadway closures or relocations.
85	How will the project mitigate these impacts?	Mitigation is discussed in Appendix G1, Transportation Technical Report, and Section 3.2, Transportation, in the 2023 Draft EIS and this Final EIS.
86	Provide a source for the PCE factor. Does it take into account the doubling of truck trips for inbound and outbound trips?	The passenger car equivalent (PCE) factor converts the number of trucks to an estimated number of passenger cars. The text has been revised to attribute the source as the Highway Capacity Manual (HCM), which recommends a range of PCE factors for trucks from 1.1 to 2.5. Using a factor of 2.5 for this analysis provides a reasonable impact estimate for the size and weight of the trucks and allows for an equal comparison across alternatives. The PCE factor was calculated for both inbound and outbound trips.

City of Federal Way (Communication ID 472867)		
Comment ID	**Comment Text**	**Response**
87	Will parking for on-site employees be provided fully on-site or will there be impacts to the surrounding network?	Employee parking is addressed in Appendix G1, Transportation Technical Report in the 2023 Draft EIS and this Final EIS. OMF South would include enough dedicated spaces for employees on site. Section 4.3.1.7, Impacts to On-Street Parking Supply, addresses construction-related parking impacts. For both the Preferred and South 344th Street alternatives, all construction activity, including staging, is expected to occur within the boundaries of project site and no impacts to on-street parking supply are anticipated.

1	Draft	03/10/21 Presentation		N/A	Per ST presentation, ST's Preferred Alternative will not define a Midway option. In selecting a preferred alternative, what will ST assume for the cost and impact at Midway? Will the Midway alternative utilized for preferred alternative selection therefore assume max cost and impact or average cost and impact of the options?	SPU	SPU Team
2	Draft	DEIS	General	N/A	Ground settlement appears to be a primary driver in the selection of Midway Landfill foundation and site preparation alternatives evaluated. All three of the selected alternatives heavily favor mitigating settlement through upfront capital improvements in lieu of mitigation through operation and maintenance. The Preliminary Geotechnical Engineering Services Report (GeoEngineers, May 6, 2019) indicates that abrupt differential settlement over the landfill is unlikely in its current condition. Additionally, actual landfill settlement observed since then has been lower than what was predicted. Site preparation for the Forest Street OMF tracks consisted of mixing 3 to 4 feet of surficial soil with cement, while ongoing settlement of the tracks is managed via hand tamping of the tracks every 3-12 months. The approach to managing track settlement through maintenance has not resulted in impacts to the overhead contact system according to Paul Denison of Sound Transit during the August 13, 2019 Midway Landfill Site Settlement Workshop. Given the high cost of proposed site prep/foundation alternatives at the Midway Landfill, would it be more economical to construct a geosynthetic reinforced subgrade beneath the tracks/parking areas and manage ongoing settlement through maintenance similar to what is done at the Forest Street OMF?	SPU	SPU Team
3	Draft	DEIS	General	N/A	There will be a considerable and varying depth of fill (up to 80 feet or more in some areas) necessary for Options 2 and 3, the full excavation/replace and hybrid options. Recycled soil screened from the landfill will be variable in composition and moisture content, making compaction control difficult to achieve when constructing this embankment. This would be true even if the material was blended with better quality imported soil as was done along I-5. Even under ideal fill and compaction conditions, it is reasonable to expect embankment fills to settle by about ¼ to ½% of their thickness (for an 80-foot thick embankment, this would be about 2 to 5 inches). Fine-grained soil placed at sub-optimum moisture content would probably result in settlement at a higher percentage (perhaps ½ to 1% or even more) of the embankment thickness. Considering that much of the soil within the landfill is fine-grained, this settlement would likely occur for a long period of time after construction, with total settlements approaching a foot and differential settlement on the order of several inches. Given the tight settlement tolerances desired by ST, I suggest investigating self-compression of the fill for Options 2 and 3, and its impact on the performance of these options.	SPU	SPU Team
4	Draft	DEIS	General	N/A	There would likely be no delay or cost due to appeals or lawsuits at Midway, should that be included as a consideration?	SPU	SPU Team
5	Draft	DEIS	General	N/A	Are local traffic impacts generated by the 470 employees considered in the DEIS?	SPU	SPU Team
6	Draft	DEIS	General	N/A	The landfill cap is designed to significantly reduce surface water infiltration if not prevent it. Multiple locations in the EIS text and appendices state that the cap reduces infiltration, but it is designed to prevent it. The description in Page 3.11-12 is the most accurate. Descriptions that say 'low-infiltration cap' should be revised to 'impervious cap'.	SPU	SPU Team
7	Draft	DEIS	2-29	N/A	Costs for real estate and relocation for the Midway alternative seem high. What do they include? What has been assumed regarding purchase and sale of the landfill property from SPU?	SPU	SPU Team

Operations and Maintenance Facility South

Conceptual Design Review Comments

Organization: Seattle Public Utilities

Date: March 25, 2021

ID	Draft Version	Section/Dwg No.	Page/Sheet No.	Line/Exhibit No.	Comment	Organization / Firm	Commenter's Name
8	Draft	DEIS	2-29	N/A	Why is the annual Operating Est at Midway so much higher than the other alts? If this is for landfill gas system, how does it compare to current landfill O&M costs? Why is the annual operating cost estimate the same for all Midway Landfill options?	SPU	SPU Team
9	Draft	DEIS	3.10-13	N/A	Statement: "Compared with other alternatives, the Midway Landfill Alternative would convert more pervious land cover to impervious" - this is misleading due to the existing landfill cap. The entire Midway Landfill site is currently impervious, due to the existing landfill cap. The grass surface would reduce peak flow, but all runoff ends up in the existing stormwater pond. It may be unlikely significant additional detention would be required in OMFS design.	SPU	SPU Team
10	Draft	DEIS	3.11-11-12	N/A	Midway landfill cap should be treated as existing impervious. 3.11-12 describes that a conservative assumption has been used that the surface is all grass and will have highest amount of conversion to impervious - the section also acknowledges the landfill cap. The assumption of grass and conversion to impervious is inappropriate.	SPU	SPU Team
11	Draft	DEIS	3.11-13	N/A	A slab and beam system in the Hybrid design option wouldn't partially impede long-term monitoring as long as monitoring wells are left accessible or replaced. Also the portion of the statement about improving local groundwater quality and the cover system by bringing it up to current protection standards is not accurate. The cover system is functioning and protective per current standards already. Potential improvement of groundwater quality is not related to improving the cover system. Potential improvement of groundwater quality may be related to refuse excavation of the hybrid and full excavation options.	SPU	SPU Team
12	Draft	DEIS	3.11-13	N/A	The drilled shafts and platform would be designed to prevent downward migration of groundwater and access for landfill gas system O&M. These considerations should not be put forward as risks. Also there is a statement that the project would bring the landfill cap system up to current protection standards. The existing landfill cap meets current protection standards.	SPU	SPU Team
13	Draft	DEIS	3.11-15	N/A	It should be noted that the waste excavation required for the hybrid and full removal alternatives is essentially equivalent. The text makes it sound like there is significantly less excavation for the hybrid.	SPU	SPU Team
14	Draft	DEIS	3.13-10	N/A	Would be appropriate to include discussion of how hazardous materials construction impacts were successfully mitigated at the FWLE here.	SPU	SPU Team
15	Draft	DEIS	3.13-9	N/A	This section talks about risk of potential uncontrolled release of methane gas from the landfill - as designed this will not occur - acknowledgement of the required and planned gas collection system should be added here. The risk of uncontrolled gas release should be different for the different Midway landfill options. Risk of uncontrolled gas release would be eliminated by the full excavation option.	SPU	SPU Team
16	Draft	DEIS	3.16-5	N/A	The text states "no archaeological resources were identified within the Midway Landfill Alternative area of impact", but then the landfill is identified as an archaeological resource on Table 3.16-1. Why?	SPU	SPU Team
17	Draft	DEIS	3-11-15	N/A	The construction impacts related to hazardous material can be mitigated. Transporting materials would be done under strict requirements and columns would be installed in a way to avoid contaminant mobilization.	SPU	SPU Team
18	Draft	DEIS	3-13-10	N/A	Same comment with respect to impacts from drilled shafts - risks can and should be mitigated.	SPU	SPU Team
19	Draft	DEIS	3-13-9	N/A	Vapor intrusion can be mitigated through sound engineering practices.	SPU	SPU Team
20	Draft	DEIS	Fig 3.11-3	N/A	This figure should have a special and different symbol for landfill cap - not a hydrologic soil group	SPU	SPU Team
21	Draft	DEIS App D4	General	N/A	Has the experience with waste removal during the FWLE been taken into consideration for this Human Health Risk Assessment? For example, the environmental professional has been collecting air monitoring data during the waste excavation-these data may be useful in risk assessment.	SPU	SPU Team

Operations and Maintenance Facility South
Draft EIS
Conceptual Design Review Comments

Organization:	Seattle Public Utilities
Date:	March 25, 2021

ID	Draft Version	Section/Dwg No.	Page/Sheet No.	Line/Exhibit No.	Comment	Organization / Firm	Commenter's Name
22	Draft	DEIS App D4	General	N/A	The vapor pathway described in the assessment does not exist if mitigation is competently designed, constructed and maintained. The risk to workers for collisions and contact with energized electrical components is more significant than the vapor exposure pathway. The waste removal options 2 and 3 further reduce risks by removing much of the source material.	SPU	SPU Team
23	Draft	DEIS App D2	14 paragraph 6	N/A	The 22 week construction window does not reflect the work process for the FWLE waste removal. This window can be expanded.	SPU	SPU Team
24	Draft	DEIS App D2	2.1-13	N/A	Why did the assumption that material screening will result in 50% of the landfill material for reuse change from the assumption used for the FWLE that 70% of the material would be reused? The FWLE portion of the landfill towards the east has the deepest refuse. The existing refuse gets shallower towards the west.	SPU	SPU Team
25	Draft	DEIS App D2	2.1-14	N/A	The EIS assumes that all volume in the landfill is refuse for their excavation calculations and that the clean cover material quantity is unknown. Clean cover soils over the landfill cap range~~s~~ from 2 to 4 feet and landfill overburden range~~s~~ from 4-14 feet above the refuse. These are significant enough quantities to be incorporated into the analysis.	SPU	SPU Team
26	Draft	DEIS App D2	2.6.1	N/A	Screened Waste from the FWLE project was shipped in open top 48 foot containers which is much more efficient.	SPU	SPU Team
27	Draft	DEIS App D2	2.7	N/A	The assumptions on density, etc. should reflect the FWLE experience instead of raw estimates.	SPU	SPU Team
28	Draft	DEIS App D2	5.0-45	N/A	Statement 3: "Costs to adjust OMF South design to address compatibility with the FWLE or modify FWLE." This statement should be modified now that OMF South options and FWLE are now compatible.	SPU	SPU Team
29	Draft	DEIS App D2	6.0	N/A	This OMFS/FWLE compatibility section appears to be outdated per comment above.	SPU	SPU Team
30	Draft	DEIS App D2	General	N/A	The assumptions regarding allowable open area 5 acre limit have no basis and lead to inefficiency in the project.	SPU	SPU Team
31	Draft	DEIS App D2	General	N/A	Trucking via 20 foot containers is unlikely and inefficient. For the FWLE project, screened out refuse was transported in 48 foot open top containers.	SPU	SPU Team
32	Draft	DEIS App D2	pg. 25 line 16	N/A	The 22 week construction window does not reflect the work process for the FWLE waste removal. This window can be expanded.	SPU	SPU Team
33	Draft	DEIS App D2	Section 7	N/A	The tolerances for settlement are not realistic. At face value they indicate that there would be no track leveling maintenance required for the first 50 years of facility operation. Many other facility elements will require replacement/renewal in that time frame - why is track leveling different.	SPU	SPU Team
34	Draft	DEIS App D2	Table 2.3	N/A	Truck trips should reflect the actual material data generatred from the FWLE work completed to date.	SPU	SPU Team
35	Draft	DEIS App D3	2.6.2.1	N/A	The text states "The recommendations also concluded that a typical soil column at the Midway landfill could be composed of between 50-70 percent waste, which would correspond to between 30 and 50 percent soil that could be considered for reuse." These percentages should be compared to what was achieved for the FWLE track project.	SPU	SPU Team
36	Draft	DEIS App D3	Section 3.2	N/A	For both excavation options, future methane generation will be negligible and will likely only require a passive vent system to prevent gas migration. Additionally, O&M costs for these options would be much less than for the option in which waste remains in place.	SPU	SPU Team
37	Draft	DEIS App D4	2.1-10	N/A	The existing landfill cap has a geomembrane liner and is designed to prevent surface water infiltration (impermeable) rather than reducing infiltration as stated in this Site Setting section.	SPU	SPU Team

Seattle Public Utilities (Communications ID 473810)		
Comment ID	**Comment Text**	**Response**
1	Per ST presentation, ST's Preferred Alternative will not define a Midway option. In selecting a preferred alternative, what will ST assume for the cost and impact at Midway? Will the Midway alternative utilized for preferred alternative selection therefore assume max cost and impact or average cost and impact of the options?	The Sound Transit Board considered the construction estimate range for all the OMF South alternatives, including the Midway Landfill Alternative and its subsurface construction design options, and did not assume an average or maximum cost. The Board also considered other factors, including the 2021 Draft EIS analysis and comments received, in identifying the South 336th Street Alternative as the Preferred Alternative for the project. The Board will also consider this information in selecting the project to be built.
2	Ground settlement appears to be a primary driver in the selection of Midway Landfill foundation and site preparation alternatives evaluated. All three of the selected alternatives heavily favor mitigating settlement through upfront capital improvements in lieu of mitigation through operation and maintenance. The Preliminary Geotechnical Engineering Services Report (GeoEngineers, May 6, 2019) indicates that abrupt differential settlement over the landfill is unlikely in its current condition. Additionally, actual landfill settlement observed since then has been lower than what was predicted. Site preparation for the Forest Street OMF tracks consisted of mixing 3 to 4 feet of surficial soil with cement, while ongoing settlement of the tracks is managed via hand tamping of the tracks every 3-12 months. The approach to managing track settlement through maintenance has not resulted in impacts to the overhead contact system according to Paul Denison of Sound Transit during the August 13, 2019 Midway Landfill Site Settlement Workshop. Given the high cost of proposed site prep/foundation alternatives at the Midway Landfill, would it be more economical to construct a geosynthetic reinforced subgrade beneath the tracks/parking areas and manage ongoing settlement through maintenance similar to what is done at the Forest Street OMF?	Ground settlement was one of many factors considered when designing the subsurface construction design options. Sound Transit endeavored to use a realistic approach to the challenges posed by the landfill site. Geosynthetic reinforcement can increase the bearing capacity of the soil and reduce settlement, but not eliminate it. The unknown density and type of waste, which would be under the geosynthetic reinforcement, would still require Sound Transit to consider the risk of differential settlement and the effect it would have on maintenance and operations.

Seattle Public Utilities (Communications ID 473810)		
Comment ID	**Comment Text**	**Response**
3	There will be a considerable and varying depth of fill (up to 80 feet or more in some areas) necessary for Options 2 and 3, the full excavation/replace and hybrid options. Recycled soil screened from the landfill will be variable in composition and moisture content, making compaction control difficult to achieve when constructing this embankment. This would be true even if the material was blended with better quality imported soil as was done along I-5. Even under ideal fill and compaction conditions, it is reasonable to expect embankment fills to settle by about ¼ to ½% of their thickness (for an 80-foot thick embankment, this would be about 2 to 5 inches). Fine-grained soil placed at sub-optimum moisture content would probably result in settlement at a higher percentage (perhaps ½ to 1% or even more) of the embankment thickness. Considering that much of the soil within the landfill is fine-grained, this settlement would likely occur for a long period of time after construction, with total settlements approaching a foot and differential settlement on the order of several inches. Given the tight settlement tolerances desired by ST, I suggest investigating self-compression of the fill for Options 2 and 3, and its impact on the performance of these options.	Considerations for long-term settlement of placed competent soils over time are valid. The general geotechnical assumption was that much of the potential settlement would occur during placement of successive lifts and that the deeper fills would not have much settlement risk by the time final grades were reached. This concern would need to be further addressed if the Midway Landfill Alternative were selected as the project to be built.
4	There would likely be no delay or cost due to appeals or lawsuits at Midway, should that be included as a consideration?	Typical schedule risks, such as those associated with permitting and construction, were considered. The EIS does not speculate about schedule ramifications associated with unknown appeals and lawsuits.
5	Are local traffic impacts generated by the 470 employees considered in the DEIS?	The potential transportation impacts associated with operation of OMF South are discussed in Section 3.2.2.2, Long-Term Impacts. This section was updated in both the 2023 Draft EIS and this Final EIS to reflect the most recent traffic data and project design.
6	The landfill cap is designed to significantly reduce surface water infiltration if not prevent it. Multiple locations in the EIS text and appendices state that the cap reduces infiltration, but it is designed to prevent it. The description in Page 3.11-12 is the most accurate. Descriptions that say 'low-infiltration cap' should be revised to 'impervious cap'.	An update to the description of the cap was made for the 2023 Draft EIS and is reflected in this Final EIS. Please see Section 3.11, Water Resources.
7	Costs for real estate and relocation for the Midway alternative seem high. What do they include? What has been assumed regarding purchase and sale of the landfill property from SPU?	In estimating real estate and relocation costs for the Midway Landfill Alternative, Sound Transit assumed a lease rather than an acquisition. The assumption was a 99-year lease at a cost of $7.6M. Sound Transit arrived at that number through an independent appraisal. No relocation costs were assumed for the landfill. Note that the total cost for real estate and relocation for the Midway Landfill Alternative includes full and partial acquisition of additional parcels beyond those owned by the city of Seattle.

8	Why is the annual Operating Est at Midway so much higher than the other alts? If this is for landfill gas system, how does it compare to current landfill O&M costs? Why is the annual operating cost estimate the same for all Midway Landfill options?	The estimated annual operating cost of the Midway Landfill Alternative (under any of the subsurface construction design options) is $13M. The estimated annual operating costs of either the South 336th or South 344th Street alternative is $12M. The additional expense is anticipated for addressing potential risks posed by ground settlement and methane gas over the lifespan of the facility. Ground settlement is a factor whether constructing over waste or the entire volume is new soil, and material used to backfill the site would be a mix of excavated material and borrow fill. While the risk of methane releases from reused material would be low, monitoring would be necessary for both health and regulatory reasons.
9	Statement: "Compared with other alternatives, the Midway Landfill Alternative would convert more pervious land cover to impervious" - this is misleading due to the existing landfill cap. The entire Midway Landfill site is currently impervious, due to the existing landfill cap. The grass surface would reduce peak flow, but all runoff ends up in the existing stormwater pond. It may be unlikely-significant additional detention would be required in OMFS design.	Section 3.10, Ecosystem Resources, of the 2023 Draft EIS was updated to reflect the results of the impervious surface land cover analysis, which is described in more detail in Section 3.11, Water Resources. This update is reflected in this Final EIS.
10	Midway landfill cap should be treated as existing impervious. 3.11-12 describes that a conservative assumption has been used that the surface is all grass and will have highest amount of conversion to impervious - the section also acknowledges the landfill cap. The assumption of grass and conversion to impervious is inappropriate.	The existing impermeable membrane cap at the Midway Landfill Alternative is described in Section 3.11, Water Resources. Table 3.11-2, Study Area Impervious Surface Land Cover Changes Analysis, was revised in the 2023 Draft EIS, to include a footnote to clarify the intent of the impervious surface analysis, which is to consider the greatest potential impacts. However, this assumption should not necessarily be used for later stormwater management design sizing. This update is reflected in this Final EIS.
11	A slab and beam system in the Hybrid design option wouldn't partially impede long-term monitoring as long as monitoring wells are left accessible or replaced. Also the portion of the statement about improving local groundwater quality and the cover system by bringing it up to current protection standards is not accurate. The cover system is functioning and protective per current standards already. Potential improvement of groundwater quality is not related to improving the cover system. Potential improvement of groundwater quality may be related to refuse excavation of the hybrid and full excavation options.	Section 3.11, Water Resources, was updated in the 2023 Draft EIS to clarify that access to the monitoring well network at the Midway Landfill would be maintained. References to improving groundwater quality by bringing the landfill cap up to current standards has been removed. These updates are reflected in this Final EIS.
12	The drilled shafts and platform would be designed to prevent downward migration of groundwater and access for landfill gas system O&M. These considerations should not be put forward as risks. Also there is a statement that the project would bring the landfill cap system up to current protection standards. The existing landfill cap meets current protection standards.	For the Midway Landfill Alternative, drilling and installing shafts through the waste into the competent ground below presents the risk of providing a downward pathway for the migration of contaminants. The 2023 Draft EIS includes a more specific discussion of mitigation through design of the drilled shafts and clarifies that access to the landfill gas monitoring system would be maintained. The statement regarding the protection standards of the landfill cap has been deleted. These updates are reflected in this Final EIS.

Comment ID	**Comment Text**	**Response**
13	It should be noted that the waste excavation required for the hybrid and full removal alternatives is essentially equivalent. The text makes it sound like there is significantly less excavation for the hybrid.	The estimated excavation amounts listed in the 2023 Draft EIS and this Final EIS (Table 2.3-2) are 4.3 million cubic yards of waste excavation for the Hybrid Subsurface Construction Design Option and 4.9 million cubic yards for the Full Excavation Subsurface Construction Design Option.
14	Would be appropriate to include discussion of how hazardous materials construction impacts were successfully mitigated at the FWLE here.	Section 3.13, Hazardous Materials, of the Final EIS has been updated to include a discussion of the Hazardous Materials Response and Sampling Plan prepared by SPU for use during the construction of FWLE and SR 509 at the Midway Landfill.
15	This section talks about risk of potential uncontrolled release of methane gas from the landfill - as designed this will not occur - acknowledgement of the required and planned gas collection system should be added here. The risk of uncontrolled gas release should be different for the different Midway landfill options. Risk of uncontrolled gas release would be eliminated by the full excavation option.	Section 3.13, Hazardous Materials, of the 2023 Draft EIS was updated to acknowledge the required gas collection system at the Midway Landfill Alternative and the differing levels of risk for each subsurface construction design option. This update is reflected in this Final EIS.
16	The text states "no archaeological resources were identified within the Midway Landfill Alternative area of impact", but then the landfill is identified as an archaeological resource on Table 3.16-1. Why?	Section 3.16, Historic and Archaeological Resources, of the 2023 Draft EIS was updated to delete that sentence. This update is reflected in this Final EIS.
17	The construction impacts related to hazardous material can be mitigated. Transporting materials would be done under strict requirements and columns would be installed in a way to avoid contaminant mobilization.	Section 3.13, Hazardous Materials, of the 2023 Draft EIS was updated to include further discussion of avoidance and minimization measures that could be used at Midway Landfill. This update is reflected in this Final EIS.
18	Same comment with respect to impacts from drilled shafts - risks can and should be mitigated.	The Avoidance and Minimization of Impacts discussion in Section 3.11, Water Resources, of the 2023 Draft EIS and this Final EIS acknowledges that concrete-filled drilled shafts or other structures to be installed would need to be designed to prevent the downward migration of more contaminated groundwater or leachate to the aquifer below.
19	Vapor intrusion can be mitigated through sound engineering practices.	Sound Transit agrees that vapor intrusion can be mitigated through sound engineering practices and BMPs. However, the EIS acknowledges that if engineering controls fail, vapor could intrude into indoor air.
20	This figure should have a special and different symbol for landfill cap - not a hydrologic soil group	Figure 3.11-3 was updated in the 2023 Draft EIS to show a different symbol for the landfill cap. This update is reflected in this Final EIS.
21	Has the experience with waste removal during the FWLE been taken into consideration for this Human Health Risk Assessment? For example, the environmental professional has been collecting air monitoring data during the waste excavation-these data may be useful in risk assessment.	The Human Health Risk Assessment was completed before Sound Transit began excavation and waste removal activities within the Midway Landfill for FWLE. If the Board selects the Midway Landfill Alternative as the project to be built, an updated human health risk assessment will be prepared and will draw from the recent FWLE experience.

Seattle Public Utilities (Communications ID 473810)		
Comment ID	**Comment Text**	**Response**
22	The vapor pathway described in the assessment does not exist if mitigation is competently designed, constructed and maintained. The risk to workers for collisions and contact with energized electrical components is more significant than the vapor exposure pathway. The waste removal options 2 and 3 further reduce risks by removing much of the source material.	Worker health and safety will always be a consideration in the decision process. While vapor intrusion can be mitigated through sound engineering practices and BMPs, the EIS acknowledges that if engineering controls fail, vapor could intrude into indoor air.
23	The 22 week construction window does not reflect the work process for the FWLE waste removal. This window can be expanded.	The supporting documents in Appendix D were written early in the conceptual design process. The assumptions made were purposefully conservative to account for unknowns. The construction window was assumed to be limited to the 22-week dry season between May 1 and September 30 to reduce the amount of precipitation that could potentially infiltrate into the open area of the landfill, which could further contribute to contaminated groundwater. FWLE was constructed on the edge of the landfill, where waste was relatively shallow. Based on the specific makeup of the excavated waste, the design-builder was able to negotiate an extended construction window with Ecology. If the Board were to select the Midway Landfill Alternative as the project to be built, Sound Transit would conduct additional geotechnical borings to assess the nature of the waste and work with regulatory agencies to set an appropriate construction schedule.
24	Why did the assumption that material screening will result in 50% of the landfill material for reuse change from the assumption used for the FWLE that 70% of the material would be reused? The FWLE portion of the landfill towards the east has the deepest refuse. The existing refuse gets shallower towards the west.	The makeup of waste is different throughout the landfill. In addition, the depth of waste is deeper to the west of the FWLE project. With a varying depth of overburden on the waste, the percentage of soil to waste changes substantially with the depth of waste. West of the FWLE alignment, the waste can be up to 80 feet deep.
25	The EIS assumes that all volume in the landfill is refuse for their excavation calculations and that the clean cover material quantity is unknown. Clean cover soils over the landfill cap ranges from 2 to 4 feet and landfill overburden ranges from 4-14 feet above the refuse. These are significant enough quantities to be incorporated into the analysis.	The available clean cover soils were identified qualitatively, not quantitatively. This was a high-level feasibility study with limited data on clean soil quantity. This method provides a reasonable approach in estimating the quantities and cost of site preparation for the project given the level of project design.
26	Screened Waste from the FWLE project was shipped in open top 48 foot containers which is much more efficient.	Final EIS Appendix D3, Conceptual Landfill Site Reuse Plan, makes an assumption that 20-foot, fully enclosed intermodal containers would be used. The analysis used the conservative assumption that contaminated materials would be transferred from trucks to rail cars at an intermodal facility and taken by rail to an approved disposal site. If the Board selects the Midway Landfill Alternative as the project to be built, Sound Transit would conduct further studies to refine construction requirements.

Seattle Public Utilities (Communications ID 473810)		
Comment ID	**Comment Text**	**Response**
27	The assumptions on density, etc. should reflect the FWLE experience instead of raw estimates.	As noted in Final EIS Appendix D3, Conceptual Landfill Site Reuse Plan, the quality of the landfill material excavated for FWLE is better understood, and the scale of work is substantially smaller than that proposed for OMF South. A number of assumptions, including soil and material density across the landfill, were made to facilitate a relative comparison of the subsurface construction design options and also to compare the Midway Landfill Alternative with the other two build alternatives.
28	Statement 3: "Costs to adjust OMF South design to address compatibility with the FWLE or modify FWLE." This statement should be modified now that OMF South options and FWLE are now compatible.	This comment is on an interim report prepared in February 2020, which has not been updated. The comment is correct in stating that the design of the FWLE project was revised to address compatibility issues with a potential OMF South at the Midway Landfill Alternative. Final EIS Section 2.3.5, Midway Landfill Site Subsurface Construction Design Options, notes the compatibility between the two projects.
29	This OMFS/FWLE compatibility section appears to be outdated per comment above.	Please see the response to Comment ID 28.
30	The assumptions regarding allowable open area 5 acre limit have no basis and lead to inefficiency in the project.	The 5-acre assumption is reasonable at the EIS stage in the planning process. The size would allow for continued control of landfill gas and water infiltration prevention. The actual size would need regulatory approval, and Ecology previously indicated they would allow only small areas to be open at a time. The 5-acre assumption was the basis for hauling transport modeling. Additional space would increase hauling and traffic impacts and could potentially overwhelm any facility receiving the material. The allowable open area would be coordinated with SPU and Ecology during final design if the Midway Landfill Alternative were selected to be built.
31	Trucking via 20 foot containers is unlikely and inefficient. For the FWLE project, screened out refuse was transported in 48 foot open top containers.	Final EIS Appendix D3, Conceptual Landfill Site Reuse Plan, assumed that 20-foot, fully enclosed intermodal containers would be used. The analysis used the conservative assumption that contaminated materials would be transferred from trucks to rail cars at an intermodal facility and taken by rail to an approved disposal site. If the Board selects the Midway Landfill Alternative as the project to be built, Sound Transit would conduct further studies to refine construction requirements.
32	The 22 week construction window does not reflect the work process for the FWLE waste removal. This window can be expanded.	Please see response to Comment ID 23.
33	The tolerances for settlement are not realistic. At face value they indicate that there would be no track leveling maintenance required for the first 50 years of facility operation. Many other facility elements will require replacement/renewal in that time frame - why is track leveling different.	Sound Transit conducts monthly inspections of track at its existing OMFs. Typically, the inspections find little track settlement. Where it does occur, it tends to be at the edge of grade crossings where the track is crossed by large trucks. In these places, periodic adjustments need to be made. It is reasonable to assume that track installed on a fill area would require relatively more settlement adjustment.
34	Truck trips should reflect the actual material data generated from the FWLE work completed to date.	The depth, type, and density of the waste on the east edge of the landfill where FWLE was built is not necessarily representative of the waste throughout the landfill. Due to this, the truck trip estimates were not updated.

Seattle Public Utilities (Communications ID 473810)		
Comment ID	**Comment Text**	**Response**
35	The text states "The recommendations also concluded that a typical soil column at the Midway landfill could be composed of between 50-70 percent waste, which would correspond to between 30 and 50 percent soil that could be considered for reuse." These percentages should be compared to what was achieved for the FWLE track project.	The soil on top of the cap can be reused. However, the soil mixed with the waste may be contaminated and not available for reuse. Due to the uncertainty of the contamination or toxicity, it is reasonable to assume that all or most of the soil must be removed. As noted in Final EIS Appendix D3, Conceptual Landfill Site Reuse Plan, the quality of the landfill material excavated for FWLE is better understood, and the scale of work is substantially smaller than that proposed for OMF South.
36	For both excavation options, future methane generation will be negligible and will likely only require a passive vent system to prevent gas migration. Additionally, O&M costs for these options would be much less than for the option in which waste remains in place.	The Hybrid and Full Excavation subsurface construction design options assumed only a passive system would be required, reducing capital redevelopment and operational costs.
37	The existing landfill cap has a geomembrane liner and is designed to prevent surface water infiltration (impermeable) rather than reducing infiltration as stated in this Site Setting section.	The description of the existing landfill cap was updated in Section 3.11, Water Resources, in the 2023 Draft EIS. This update is reflected in this Final EIS.

Re: Sound Transit OMF South Project: Draft Environmental Impact Statement (DEIS) – Comments From Christian Faith Center (CFC)

Dear Mr. Rehmat:

On behalf of our client Christian Faith Center (CFC), we submit these comments for review in the EIS process. As you know, the CFC Campus is identified in two of the three alternatives for the South OMF Project. The South 336th Street Alternative would take all of the CFC Campus. The South 344th Street Alternative would take approximately half of the CFC Campus. Our primary comments on the DEIS at this time are:

1. CFC would prefer to not be any alternative for the OMF South Project. Any comments below are for the sole purpose of informing Sound Transit of the consequences and impacts to CFC from the two alternatives noted above and are not an express or implied consent to any selection of CFC as the preferred site for the OMF South Project.

2. The DEIS has not adequately understood and analyzed the CFC Campus, which has led to a flawed analysis of, in particular, the South 344th Street Alternative. More on this comment follows below.

Background.

CFC's story begins in 1980 with the formation of CFC to pursue its mission of spreading the word of Jesus. CFC had a vision of a future campus for its ministry with a place of convening for worship, a school, a day care facility, a college, and associated facilities. That vision became reality in the early 2000's with the acquisition of its campus property and associated land use approvals, specifically the Concomitant & Development Agreement & Development Plan (City of Federal Way, Ordinance 04-461, July 20, 2004). A copy of this 107 document is attached hereto and shall be referred to as the Campus Approval.[1]

As is evident from the Campus Approval, the CFC Campus would develop in Phases, but the necessary development infrastructure for the entire site would be integrated and planned up front. By way of example only and not meant to be exhaustive, some of the important elements include:

- Planned recreational areas. Campus Approval at Section 9.1.5.4
- Extensive traffic mitigation, including multiple points of ingress and egress. Campus Approval at Section 9.4.
- Surface mitigation/storm water detention facilities. Campus Approval at Section 9.6.
- Wetland Mitigation. Campus Approval at Section 9.7.

Impacts to CFC.

Ever since CFC's Campus has been identified as a potential site for the OMF South Project, CFC has essentially been "stuck" in place and time. CFC has halted the planning and implementation of additional projects. CFC cannot grow and expand its ministry. This is true for both the South 336th Street Alternative and the South 344th Street Alternative.

CFC's selection as a site for the South OMF facility has created uncertainty and anxiety for tis members. Is their spiritual "home" going to be taken from them? Where will they go?

If the South 336th Street Alternative becomes the final site, then CFC will be forced to lose its Campus as a whole under eminent domain or the treat of eminent domain and find a new campus location and start a new multi-year development process anew. This is no easy task.

If the South 344th Street Alternative becomes the final site, CFC's situation becomes even worse. The DEIS simply and incorrectly assumes that the current site could be severed or bifurcated and somehow CFC could continue to operate on the remainder parcel.

---

[1] A copy of the enclosure is available at https://docs.cityoffederalway.com/WebLink/DocView.aspx?id=192244&page=1&dbid=0&repo=CityofFederalWay

Because the Campus Approval is an integrated plan for the entire CFC Property, taking a significant portion for the South 344th Street Alternative disrupts the entire plan and creates a situation where CFC would be in violation of its approvals. Again, by way of example only and not to be exhaustive, taking the eastern portion of the CFC Campus for the South 344th Street Alternative Project means:

- The remainder parcel no longer has a required storm water facility for its surface water management.
- CFC's required access points no longer exist, because the DEIS assumes, incorrectly, that CFC uses only one access point. It is required to have multiple.
- CFC's required recreational areas disappear.

Beyond, the physical, land use, and environmental impacts are fiscal impacts. CFC has long term financing for its current Campus. Taking a significant portion of the property would impair the lender's collateral. Its loan would be called. With the remainder of the property now a non-conforming and non-compliant property, no lender would extend credit. The City of Federal Way could commence code enforcement action requiring CFC to come into compliance with storm water, access, and recreational facilities requirements, which CFC could not meet.

CFC respectfully requests that Sound Transit carefully review the 107 page Campus Approval document to refine its analysis of impacts associated with the South 344th Street Alternative.

Thank you for considering these comments. CFC reserves the right to provide supplemental comments (whether within or external to the EIS process) as appropriate.

Very truly yours,

JAMESON PEPPLE CANTU PLLC

ORDINANCE NO. 04-461

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF FEDERAL WAY, WASHINGTON, RELATING TO LAND USE, ADOPTING AMENDMENTS TO THE CITY'S GROWTH MANAGEMENT ACT COMPREHENSIVE PLAN AND ADOPTING AMENDMENTS TO THE CITY'S ZONING MAP, CHANGING THE COMPREHENSIVE PLAN DESIGNATION AND ZONING FOR 49.97 ACRES LOCATED SOUTH OF S. 336TH STREET BETWEEN PACIFIC HIGHWAY SOUTH AND INTERSTATE 5 FROM BUSINESS PARK (BP) TO MULTIFAMILY RESIDENTIAL 3600 (RM 3600), AND ADOPTING AN ASSOCIATED CONCOMITANT AND DEVELOPMENT AGREEMENT AND DEVELOPMENT PLAN.

WHEREAS, the Growth Management Act of 1990, as amended, (Chapter 36.70A RCW or "GMA") requires the City of Federal Way to adopt a comprehensive plan which includes a land use element (including a land use map), housing element, capital facilities plan element, utilities element, and transportation element (including transportation system map[s]); and

WHEREAS, the GMA also requires the City of Federal Way to adopt development regulations implementing its comprehensive plan; and

WHEREAS, the Federal Way City Council adopted its comprehensive plan with land use map (the "Plan") on November 21, 1995, and adopted development regulations and a zoning map implementing the Plan on July 2, 1996; and subsequently amended the comprehensive plan, land use map, and zoning map on December 23, 1998, September 14, 2000, and November 1, 2001; and March 27, 2003; and

WHEREAS, under RCW 36.70A.130, by December, 2004, all jurisdictions within Washington State must take action to review and, if needed, revise its comprehensive plan and development regulations to ensure that they comply with the GMA; and

WHEREAS, the City may consider Plan and development regulation amendments pursuant to Article IX, Chapter 22 of the *Federal Way City Code* (FWCC); and

WHEREAS, under RCW 36.70A.130, the Plan and development regulations are subject to continuing review and evaluation, but the Plan may be amended no more than one time per year; and

WHEREAS, the Council shall be considering three separate actions to amend the Plan, all of which will be acted upon simultaneously in order to comply with RCW 36.70A.130; and

WHEREAS, these actions include adoption of a Potential Annexation Area (PAA) Subarea Plan, which will replace Chapter 8, Potential Annexation Areas of the Federal Way Comprehensive Plan and address certain comprehensive plan text changes pertaining to the Community Business (BC) comprehensive plan designation and zoning; and

WHEREAS, these actions include deletion of the planned extension of Weyerhaeuser Way South, north of South 320th Street, shown on Map III-27B from the Comprehensive Plan and deletion of this project from Table III-19 (Regional CIP Project List); and

WHEREAS, these actions include a change in comprehensive plan designation and zoning from Business Park (BP) to Multifamily Residential 3600 (RM 3600) through adoption of an associated concomitant and development agreement and development plan for 49.97 acres located south of S. 336th Street between Pacific Highway South and Interstate 5, referred to herein as the Christian Faith Center Property; and

WHEREAS, in 2000, the City of Federal Way accepted requests for amendments to the text and maps of the comprehensive plan and applications for site-specific changes to the Plan's land use map and the City's zoning map, and considered amendments to the text and maps of the comprehensive plan and to the Plan's land use map and the City's zoning map, including a request to change the Christian Faith Center Property from Business Park (BP) to Multifamily Residential 3600 (RM 3600); and

WHEREAS, on July 4, 2001, the City SEPA Responsible Official issued a Determination of Nonsignificance on the proposed Plan and zoning map amendment; and

WHEREAS, Pursuant to FWCC Section 22-1660, development agreements associated with a comprehensive plan designation and related zoning change may be used at the City Council's discretion, where the project is larger in scope and has potentially larger impacts than normal, or where the City Council may desire to place certain restrictions on the proposal; and

WHEREAS, A Concomitant Agreement and Development Agreement has been prepared for the proposed project on the Christian Faith Center Property (the "Project") in order to fully address and mitigate all identified impacts associated with the project, and the Concomitant Agreement allows for a rezone of the property but limits the allowable use of the property to a church, a school, and accessory uses, and the Agreement is accompanied by a Development Plan (*Exhibit B* to the Agreement) as required by FWCC Section 22-1669, and prepared in accordance with FWCC Section 22-1664; and

WHEREAS, Pursuant to the State Environmental Policy Act (SEPA), the City issued Draft and Final Environmental Impact Statements (EIS) for the Project on November 18, 2003, and March 3, 2004, and EIS Addenda on April 16, 2004 and May 21, 2004, and four public meetings were conducted during the environmental review process for the proposed Project which included an EIS Scoping Meeting on August 27, 2002, Neighborhood Traffic Meeting on May 8, 2003, Draft Environmental Impact Statement (DEIS) hearing on December 12, 2003, and City Council EIS briefing on March 15, 2004; and

WHEREAS, the proposed Plan and zoning map changes address all of the goals and requirements set forth in the GMA; and

WHEREAS, the proposed Concomitant and Development Agreement and Development Plan address all of the goals and requirements set forth in the FWCC; and

WHEREAS, the City of Federal Way, through its staff, Planning Commission, City Council committees, and full City Council has received, discussed, and considered the testimony, written comments, and material from the public, as follows:

1. The City's Planning Commission considered the request for amendment to the comprehensive plan at public hearings held on July 18, 2001, August 15, 2001, and September 19, 2001, following which it forwarded a recommendation to the City Council; and

2. The Land Use and Transportation Committee of the Federal Way City Council considered the proposed site-specific changes to the Plan's land use map and the City's zoning map on October 1, 2001 at which time it requested a development agreement and development plan be prepared for the Project; and

3. The full City Council considered the proposed change to the Plan's land use map and the City's zoning map and the associated Concomitant and Development Agreement and Development Plan on May 24, 2004, and June 15, 2004; and

WHEREAS, the City Council desires to adopt the changes to the Plan's land use map and City's zoning map and associated Concomitant and Development Agreement and Development Plan;

NOW, THEREFORE, the City Council of the City of Federal Way, Washington, does hereby ordain as follows:

Section 1. Findings and Conclusions.

A. The proposed amendment to the comprehensive plan land use map, as set forth in Exhibit A hereto, reflects new or updated information developed since the initial adoption of the comprehensive plan. It bears a substantial relationship to public health, safety, and welfare; is in the best interest of the residents of the City; and is consistent with the requirements of RCW 36.70A, the King County Countywide Planning Policies, and the unamended portion of the Plan. The amendment, as mitigated, is compatible with adjacent land uses and surrounding neighborhoods and will not negatively affect open space, streams, lakes or wetlands, or the physical environment in general. It will allow for growth and development consistent with the Plan's overall vision and with the Plan's land use element household and job projections, and/or will allow reasonable use of property subject to constraints necessary to protect environmentally sensitive areas. It therefore bears a substantial relationship to public health, safety, and welfare; is in the best interest of the residents of the City; and is consistent with the requirements of RCW 36.70A, the King County Countywide Planning Policies, and the unamended portion of the Plan.

B. The proposed amendment to the Zoning Map, set forth in Exhibit B, attached hereto, adopted pursuant to the concomitant agreement, is consistent with the applicable provisions of the comprehensive plan and the comprehensive plan land use map proposed to be amended in Section 2 below, bears a substantial relation to public health, safety, and welfare, and is in the best interest of the residents of the City.

C. The Concomitant and Development Agreement and Development Plan, as set forth in Exhibit C, attached hereto, is consistent with RCW 36.70B, RCW 43.21C, and FWCC Chapter 22, Article XXI.

D. Additional Findings and Conclusions are attached as Exhibit D and incorporated herein by this reference as if set forth in full.

Section 2. Comprehensive Plan Amendments Adoption. The 1995 City of Federal Way comprehensive plan, as thereafter amended in 1998, 2000, 2001, and 2003, including its land use element map, copies of which are on file with the Office of the City Clerk, hereby are and shall be amended as set forth in Exhibit A attached hereto and is hereby incorporated by this reference as if set forth in full.

Section 3. Zoning Map Amendments Adoption. The 1996 City of Federal Way Official Zoning Map, as thereafter amended in 1998, 2000, 2001, and 2003 is hereby amended as set forth in Exhibit B, pursuant to the Concomitant and Development Agreement, and is hereby incorporated by this reference as if set forth in full.

Section 4. Concomitant and Development Agreement and Development Plan Adoption. The Concomitant and Development Agreement and Development Plan, attached as Exhibit C, is hereby adopted and incorporated herein by this reference as if set forth in full.

Section 5. Amendment Authority. The adoption of Plan amendments is pursuant to the authority granted by Chapters 36.70A and 35A.63 RCW, and pursuant to FWCC Section 22-541. The adoption of the Concomitant and Development Agreement and Development Plan is pursuant to the authority granted by Chapter 36.70B RCW and pursuant to FWCC Chapter 22, Article XXI.

Section 6. Severability. The provisions of this ordinance are declared separate and severable. The invalidity of any clause, sentence, paragraph, subdivision, section, or portion of this ordinance, or the invalidity of the application thereof to any person or circumstance, shall not affect the validity of the remainder of the ordinance, or the validity of its application to other persons or circumstances.

Section 7. Savings Clause. The 1995 City of Federal Way Comprehensive Plan, and 1996 Zoning Map, as thereafter amended in 1998, 2000, 2001, and 2003 shall remain in full force and effect until the amendments thereto become operative upon the effective date of this ordinance.

Section 8. Ratification. Any act consistent with the authority and prior to the effective date of this ordinance is hereby ratified and affirmed.

Section 9. Effective Date. This ordinance shall take effect and be in force five (5) days from and after its passage, approval, and publication, as provided by law.

PASSED by the City Council of the City of Federal Way this **20th** day of **July**, 2004.

CITY OF FEDERAL WAY

Dean McColgan

Mayor, Dean McColgan

CONCOMITANT AND DEVELOPMENT AGREEMENT AND DEVELOPMENT PLAN

CONCOMITANT AGREEMENT
AND
DEVELOPMENT AGREEMENT

BETWEEN THE CITY OF FEDERAL WAY AND THE CHRISTIAN FAITH CENTER FOR DEVELOPMENT OF CHURCH AND PRIVATE SCHOOL

JULY 20, 2004

The City of Federal Way ("City") and the Christian Faith Center ("CFC"), a Washington nonprofit corporation, collectively referred to herein as "the Parties", enter into the following concomitant agreement and development agreement ("Agreement") regarding the rezoning of certain property and the scope of permissible development, use, and mitigation of environmental impacts associated with the campus development of a church and private school ("Project"), through construction of the buildings and related improvements on the CFC property.

The agreement is both a concomitant agreement and a development agreement. The concomitant agreement allows for a rezone of certain property subject to development standards and conditions governing the use of the property. The development agreement provides the developer with certainty regarding the local regulations and mitigation requirements that will govern development for a specified project. The concomitant agreement is a condition to and limitation upon the rezone of the property, if adopted by the City Council. That is, if the site is rezoned subject to concomitant agreement, its use and development is restricted both by the regulations applicable to the new zoning classification and the provisions of the concomitant agreement, and where development standards in the agreement are more restrictive, they govern property development. The development of the property is conditioned and limited by both the development agreement and concomitant agreement, and they have been combined into one document.

1. **Location.** CFC is the owner of certain real property situated in Federal Way, Washington, located south of South 336th Street between SR-99 and Interstate 5 (the "Property"). The Property is more particularly described on Exhibit A attached hereto and incorporated herein by this reference.

2. **Project Description.** The Project consists of development of a 218,500 square foot building for church sanctuary/school auditorium/administrative services a 101,526 square foot private school building, and associated parking and recreational and athletic fields as depicted on the Development Plan, attached hereto as Exhibit B and incorporated herein by this reference (the "Plan" or "Development Plan").

3. **Concomitant Agreement.** If the Property is rezoned from Business Park (BP) to RM 3600 by the Federal Way City Council, CFC and the City agree that the Property may be developed only in accordance with the standards and mitigation set forth in the Agreement. The Property shall be developed as described in the Agreement, and as depicted in the Development Plan. The allowable use of the property shall be limited to that described in the Agreement. All development standards, including mitigation, identified in the Agreement shall apply to Property development. No development on the Property shall be inconsistent with the Agreement or City Code. The Property is subject to the Agreement, and shall be developed only in accordance with the development standards identified within the Agreement, including the Development Plan (except for minor modifications permitted by Section 10 of the Agreement), unless and until the Agreement is amended or rescinded, as authorized by the City.

4. **Development Agreement.** The Agreement is authorized by RCW 36.70B.170 through .210 and FWCC 22-1660 through 22-1680. It addresses Project development standards, which are defined in the statute to include, for example, impact fees, mitigation, design standards, phasing issues, review procedures, vesting issues, and any other appropriate development requirements.[1] The Agreement provides the City and CFC with certainty as to the type of Project that will be built, the type of mitigation that will be provided, and the development regulations to which the Project will vest.

The Project is consistent with current local regulatory requirements.[2] As authorized by state statute,[3] the Agreement identifies mitigation under City codes and the State Environmental Policy Act (Chapter 43.21C RCW, "SEPA") required for the project.

5. **Vesting.** City development regulations, as found in the Federal Way City Code (FWCC) or otherwise legislatively adopted[4], and the mitigation measures adopted herein shall govern the Project for a period of five years, dating from execution of the Agreement. Any amendments or additions made to City development regulations during the five year period shall not apply to or affect the development, except as otherwise provided, or if other county, state or federal laws preempt the City's authority to vest regulations. The City reserves the authority to impose new or different officially adopted regulations to the extent required by a serious threat to the public health and safety.[5] After the five-year period, amendments or additions made by the City to these development regulations and the mitigation measures adopted herein shall apply to any subsequent or further development of the Property. Otherwise, the Property and the uses thereof that are developed consistent with this Agreement shall be deemed legal, nonconforming uses. Provisions of the Agreement, including specifically identified development standards and mitigation measures, do not terminate after the five-year period and continue to restrict development of the Property unless and until amended by the City.

6. **Project Mitigation Under SEPA.** The Project has been subject to detailed environmental review. A Final Environmental Impact Statement ("FEIS") was issued on March 3, 2004 and addenda were issued April 16, 2004 and May 21, 2004. Mitigation of significant adverse environmental impacts imposed under SEPA, through the City's SEPA regulations, is incorporated into the Agreement.

7. **Development of CFC Property.**

7.1 Permitted Uses. CFC covenants and agrees that it will limit any use of the Property to the church and school uses, as depicted in the Development Plan, attached as Exhibit B. Both the church and school are classified as principal uses for application of FWCC Sections 22-671 and 22-674. Accessory uses shall be limited to those approved as a part of this Agreement and shown on the attached Plan or List of Permitted Accessory Uses, attached as Exhibit C, or any accessory use determined by the Director of Community Development Services to be allowed, or analogous to an allowed accessory use, in the RM 3600 zone.

7.2 Relationship Between City Development Regulations and Development Standards Identified in Agreement. Development Regulations include all provisions of the Federal Way City Code (FWCC), including without limitation FWCC Chapters 18 through 22. The Development Regulations for the Property include those applicable to the RM 3600 zone and as set forth in the Agreement. The Agreement establishes site specific development standards, including mitigation. Property development shall be consistent with both development regulations and the development standards identified in the Agreement. Where the development standards in the Agreement are more restrictive, they shall govern development of the Property, as specified herein.

---

[1] RCW 36.70B.170(3).

[2] RCW 36.70B.170(1).

[3] RCW 36.70B.170(3)(c).

[4] Legal requirements include legislatively adopted standards governing development, such as zoning, building and development regulations, impact fees, SEPA regulations and substantive SEPA policies, and other laws, ordinances or policies.

[5] See RCW 36.70B.170(4).

7.3 Construction Phasing. Project construction shall be limited to two phases. Phase One shall comprise construction of the building for the church sanctuary, auditorium, meeting rooms and administrative offices, and the first 81,323 square feet of the school building, together with all on-site and off-site improvements required by this Agreement and by the conditions of any related permit approval. Phase Two shall comprise construction of a future second-story 20,203 square foot addition to the school building. Each phase, with the exception of improvements completely within the interior of a building, must be substantially completed within twenty-four (24) months of issuance of the building permit for that phase, except for delays beyond the control of CFC and approved by the Director of Community Development Services which approval shall not be unreasonably withheld. Project construction shall be completed within five years of the execution of this Agreement, except for delays beyond the control of CFC and approved by the Director of Community Development Services which approval shall not be unreasonably withheld.

8. Settlement Agreement. The Parties shall be bound by the Settlement Agreement between the City of Federal Way and Federal Way Industrial Park, Inc., dated February 5, 1996, attached hereto as Exhibit D and incorporated herein by this reference. The Settlement Agreement provides certain development standards and other provisions applicable to use and development of the Property, which are consistent with the terms of this Agreement. The terms of this Agreement shall control over any inconsistent terms in the Settlement Agreement.

9. Development Standards, Including Mitigation. The Project shall be consistent with all specified development standards. CFC shall construct, install or implement, as part of Project Construction, all mitigation required by the Agreement. The City Council has reviewed the EIS and the record. Mitigation has been developed based on these documents.

9.1 Project Design and Site Configuration.

9.1.1 Building Setback. All site improvements shall be setback from South 336th Street a minimum of 50 feet. The property bordering South 336th Street shall be deemed the front yard for purposes of this Agreement. Remaining rear and side setbacks for the church building shall be 30 feet from any property line or right-of-way. Remaining side and rear setbacks for the school building, ball fields, and any playground equipment shall be 50 feet from any property line or right-of-way.

9.1.2 Building Height. The maximum allowed height of single-story elements of the church building is 35 feet above average building elevation (ABE), with up to three additional feet allowed for articulated cornices; the maximum allowed height for second-story elements containing offices, classrooms, library and similar uses is 40 feet above ABE. The maximum height of the school building is 40 feet above ABE with up to three additional feet allowed for articulated cornices. The maximum allowed height for the church sanctuary/school auditorium portion of the building and the gymnasium is 55 feet above ABE.

9.1.3 Landscaping. CFC shall provide an approved landscape plan, prior to issuance of the Phase One building permit, incorporating the following features. The landscape plan shall be prepared by a landscape architect in consultation with a habitat biologist, whose recommendations shall be incorporated into the plan.

9.1.3.1 Perimeter Landscaping. CFC shall provide a combination of existing and new native landscaping to accomplish Type III landscaping along all property lines and public rights-of-way and access easements. Along South 336th Street, landscaping shall be 50 feet in width consisting of 25 feet of a combination of Existing Native and Type III landscaping and 25 feet of Type IV landscaping. Along all other property lines associated with that portion of the Property containing the church, landscaping shall be 15 feet in width consisting of 10 feet of a combination of Existing Native and Type III landscaping and 5 feet of Type IV landscaping. Wetlands and wetland buffers which are vegetated in accordance with a City approved wetland mitigation plan and landscape plan and which are in excess of fifty (50) feet between the development and the property line shall be deemed to have satisfied the landscaping requirements of that property line.

9.1.3.2 Detention Pond Landscaping. Landscaping around detention ponds shall comply with the approved landscape plan and include at a minimum provision for dense bank cover and trees larger than the minimum required by FWCC to provide shade and reduce water temperature. For purposes of this Agreement, the term "larger" means deciduous trees larger than 3 inch caliper and evergreen trees taller than eight feet.

9.1.3.3 Habitat Retention. CFC shall provide a fifty (50) foot wide wildlife corridor from the west wetland to the east wetland with small animal culvert crossings under proposed roads and water ponding areas along the wildlife corridor, at a spacing of approximately 200 feet, to provide drinking areas for small animals.

9.1.4 Parking.

9.1.4.1 Setback. Parking shall be permitted within the required side and rear yards, but not within 10 feet of any property line associated with the school or within 15 feet of any property line associated with the church or within any required buffer.

9.1.4.2 Number of Stalls. CFC shall provide a minimum of 1,406 parking stalls and a maximum of 1,540 parking stalls.

9.1.4.3 Parking Dimensions. Maximum parking lot and stall dimensional requirements shall be equivalent to corresponding minimum FWCC requirements except as modified by the attached Exhibit E.

9.1.4.4 Overflow Parking/Special Events. Overflow parking shall be permitted only pursuant to a parking plan approved by the Director of Public Works. CFC shall develop and submit a plan for approval by the Director of Public Works prior to special events to manage overflow parking through an arrangement with an appropriate transit provider or local hosts for shared use of additional off-site parking spaces and shuttle transportation connecting the overflow parking areas and the site during special events or in the event of recurring overflow parking conditions. CFC shall be responsible for all costs associated with traffic control including, but not limited to, flaggers, police officers, signs, and shuttle transportation.

9.1.5 Size Limitation.

9.1.5.1 School. The school structure shall be limited to 101,526 square feet, including 81,323 square feet in Phase One and 20,203 square feet in Phase Two, as depicted in the attached Conceptual Floor Plan, Exhibit F. The day care shall be located in the main church/sanctuary/administration building and shall be limited to 33,000 square feet. Based on these maximum square footages, total enrollment of the school and daycare shall be limited to a maximum of 900 full-time students.

9.1.5.2 Sanctuary. Sanctuary occupancy shall conform to all applicable local, state and federal laws and regulations and shall not exceed 4,500 occupants.

9.1.5.3 College. The Dominion College shall be considered an accessory use to the church and as such shall primarily serve CFC students and staff and members of the CFC congregation. The Dominion College shall be limited to 23,000 square feet as depicted in the attached Conceptual Floor Plan, Exhibit F. Based on this square footage, enrollment shall be limited to a maximum of 225 students.

9.1.5.4 Recreation Areas. Exterior recreation and play areas shall be provided in a minimum amount of 27,026 square feet in the school yard, a minimum 100,000 square feet in the recreation/sports field, and 4,613 square feet in the church day care area. Such minimum areas shall be permanently maintained as recreation and play areas.

9.2 Operational Limitations. CFC operations shall be consistent with the schedule and restrictions listed below. Changes in the below schedule, which was provided by the applicant, shall be reviewed under FWCC 22-1680 to ensure that the project remains consistent with the review completed under SEPA and the FWCC. Minor modifications may be approved by the Director of Community Development Services, as specified in FWCC 22-1680.

9.2.1 Church Service Hours. Church services shall be limited to one weekday evening service (typically on Wednesdays) which shall not begin before 6:30 p.m. and Sunday church services shall be separated by at least one and one/half hours between services.

9.2.2 Dominion College Hours. Dominion College classes shall not be held on weekends or between the hours of noon and 6:30 p.m. weekdays.

9.2.3 Bible Study Hours. Bible Study classes shall be held only weekdays before noon.

9.2.4 School Hours. School classes shall be completed no later than 3:30 p.m. daily.

9.2.5 Holiday Services/Special Events. Holiday services and special events shall be scheduled consistent with the approved Traffic Management Plan (TMP) required by 9.4.12 and consistent with 9.1.4.4.

9.3 Construction Mitigation.

9.3.1 Erosion Sediment Control. CFC shall designate and provide an onsite Erosion Sediment Control (ESC) Supervisor approved by the Director of Public Works, who possesses a Construction Site Erosion and Sediment Control Certification by the Washington State Department of Transportation (WSDOT). This ESC Supervisor shall be available for the duration of the project. The qualifications and responsibilities of the ESC Supervisor are outlined in the 1998 King County Surface Water Design Manual (KCSWDM) and City of Federal Way Addendum. The Director of Public Works may further limit clearing and grading activities on the site based on recommendations from the ESC Supervisor and requirements of the KCSWDM.

9.3.2 Stormwater Pollution Prevention Plan. A construction Stormwater Pollution Prevention Plan (SWPPP) shall be provided by CFC and reviewed and approved by the Director of Public Works prior to issuance of any construction permits or authorizations. Construction phasing shall be included in this plan. CFC has proposed several BMP's which shall be captured in the SWPP plan including, but not limited to, confining refueling and equipment maintenance to a hard-surface staging area with spill containment features and a spill clean-up kit, and pipe slope drains used to convey storm water over steep slopes.

9.3.3 Clearing and Grading. Clearing and grading shall be allowed only pursuant to a phased construction plan approved by the Director of Public Works. Clearing and grading shall occur only between May 1 and September 30 unless otherwise approved by the Director of Public Works.

9.4 Traffic Mitigation. CFC shall perform, as part of Project construction and prior to issuance of certificate of occupancy unless otherwise noted, the following traffic mitigation as required and approved by the Director of Public Works.

9.4.1 CFC shall reconstruct 18th Avenue South from the existing berm to S 344th Street to a modified street section, consisting of 24 foot wide street with vertical curb and gutter, 5-foot sidewalks, and two additional street lights mounted on existing power poles, consistent with the attached Exhibit G-1. Traffic calming elements shall be installed, including 2 speed humps, 1 crosswalk, bulb outs at the intersection of 18th Avenue South and S 341st Street and 18th Avenue South and S 344th Street to narrow the throat width of 18th Avenue South to 20 feet, and street signage shall be installed to address no through truck traffic, children playing, speed humps, crosswalk and speed limit.

9.4.2 CFC shall improve S 344th Street from 16th Avenue S to 18th Avenue S consistent with the attached Exhibit G-2. Construction shall consist of Type R Street. The north side shall consist of a 40 foot wide street with curb and gutters, 4 foot planter strip with street trees, 6 foot sidewalk, and street lights. The improvements shall be tied into the existing improvements to the west end of S 344th Street to the east side of the intersection of S 344th Street and 16th Avenue S. On the south side, only curb and gutter shall be required. CFC shall construct improvements within existing right-of-way.

9.4.3 CFC shall improve S 344th Street through the intersection of 16th Avenue S and shall signalize the intersection of S 344th/16th Ave S consistent with the attached Exhibit G-3. CFC shall construct improvements within existing right-of-way.

9.4.4 CFC shall construct street improvements consistent with the attached Exhibit G-4 to signalize the intersection of SR 99 and S 344th Street and provide a westbound-to-southbound left-turn lane within existing right-of-way. If delays beyond the control of CFC and the City prevent the completion of these improvements by the time of issuance of certificate of occupancy, CFC may obtain a certificate of occupancy subject to the Public Works Director requiring temporary traffic control measures for up to one hour following the end of each Sunday service until such time that the traffic signal is operational.

9.4.5 CFC shall perform a sight distance study, propose a conceptual intersection plan for the intersection of 20th Avenue S at S 341st Street to be approved by the Director of Public Works, and construct improvements as determined by the Director of Public Works.

9.4.6 CFC shall construct street improvements along S 336th Street consistent with the attached Exhibits G-5 and G-6. The improvements shall be consistent with Type M street between SR 99 and 20th Avenue S, consisting of an 18-foot half-street with curbs and gutter, 6-foot planter strip with street trees, 8-foot sidewalk, street lights, underground utilities, and 3-foot utility strip. Improvements will be consistent with Type K street between 20th Avenue S and I-5, consisting of a 22-foot half-street with curb and gutter, 6-foot planter strip with street trees, 8 foot sidewalk, street lights, underground utilities, and 3-foot utility strip. A continuous two-way left-turn lane shall be provided between SR 99 and Forest Lane Town Homes frontage. Curbs and gutter, planter strip, and sidewalk shall also be provided on the north side between South Garden Court condominiums and Forest Lane Town Homes to tie into the existing improvements. An eastbound right-turn lane shall be provided on S 336th Street at 20th Avenue S, consisting of a 100-foot storage length and 50-foot taper length. These improvements may be modified by the Director of Public Works to minimize impacts to wetlands or minimize right-of-way acquisition.

9.4.7 CFC shall improve 20th Avenue S for a distance of 225 feet (175 feet of storage and 50 foot taper) to the North of the intersection of S 336th Street and signalize the intersection consistent with the attached Exhibit G-7.

9.4.8 CFC shall construct an eastbound right turn lane from S. 336th Street to 20th Avenue S.

9.4.9 CFC shall construct traffic calming elements on 20th Avenue S from S 336th Street to S 330th Street, including traffic circles at S 330th Street and S 332nd Street and an island diverter at S 336th Street to prevent northbound and southbound through movements, and construct a sidewalk on the east side of 20th Avenue S from S 336th

Street to tie in to the existing sidewalk, consistent with the attached Exhibits G-7 and G-8. CFC shall construct improvements within existing right-of-way.

9.4.10 CFC shall provide two transit shelters, shelter footings, litter receptacle pads, landing pads and benches, one located on 20th Avenue S in the existing location north of S 336th Street and one located on S 336th Street as determined by City staff with input from King County Metro and Pierce Transit.

9.4.11 Upon a one time request of the Director of Public Works, CFC shall develop and implement Sunday peak hour timing plans, based on turning movement counts for signal timing plans collected by CFC for the intersections of 20th Avenue S and S 336th Street, SR 99 and S 324th Street, SR 99 and S 330th Street, SR 99 and S 336th Street, SR 99 and S 340th Street, 16th Avenue S and S 344th Street, and SR 161 and S 348th Street.

9.4.12 CFC shall implement a Traffic Management Plan (TMP) for the Project as approved by the Director of Public Works.

9.4.13 CFC shall pay to the City Three Hundred Fifty Thousand and No/100 Dollars ($350,000.00) to expand the City's existing project at the intersection of S 348th Street and SR 161 to provide for the construction of a second northbound right-turn lane with 550 feet of storage. Payment shall be made one year after receipt of the Certificate of Occupancy for Phase One of the Project or upon award of the bid to construct the turn lane whichever shall occur first.

9.4.14 CFC shall pay to King County its pro rata share contribution to the King County Transportation Improvement Plan (TIP) project at South 320th Street and Military Road in the amount of Six Hundred Forty-Seven and No/100 Dollars ($647.00).

Except as provided above, CFC shall use its best efforts to acquire any and all right-of-way necessary to complete the improvements described in this Agreement. If, through no fault of CFC, CFC is unable to acquire right-of-way necessary to complete the improvements described, the City and CFC agree to meet and confer on possible alternatives. The Director of Public Works may modify the required improvements as necessary provided impacts are mitigated.

9.5 Payment of Pro Rata Share. CFC shall pay, prior to issuance of the certificate of occupancy for Phase One of its construction as defined in this Agreement, its pro rata share contribution to impacted City Transportation Improvement Plan (TIP) projects, identified and calculated below:

- S 348th Street: 9th Ave S – SR 99: $60,500
- S 356th St: 1st Ave S – SR 99: $50,200
- S 348th St @ 1st Ave S: $13,100
- S 336th St @ 1st Way S: $3000
- 12th Ave SW / SW 344th St Extension: SW Campus Dr – 21st Ave SW: $38,700
- 1st Ave S: S 320th St – S 330th St: $7600
- 21st Ave SW Extension: SW 356th St – 22nd Ave SW: $2800
- SR 18 @ SR 161: $24,800
- S 336th St @ 9th Ave S: $1100

- S 320th St @ I-5: $34,100

Total $235,900

9.6 Surface Water Mitigation. The following storm water mitigation, as required and approved by the Director of Public Works, shall be designed by CFC prior to issuance of construction permits or authorizations and constructed by CFC prior to issuance of certificate of occupancy.

9.6.1 CFC shall design and construct the east basin storm water detention pond to meet Level 2 flow control standards.

9.6.2 Consistent with the Process IV Hearing Examiner Decision, CFC shall design and construct all runoff from the Sanctuary roof for the 2 year storm event to be collected and dispersed through percolation trenches to maintain wetland hydrology in the westerly wetland.

9.6.3 CFC shall design and construct all surface water treatment facilities from the East and West 1 subcatchments to include the use of Stormwater Management® filter vault systems which meet or exceed Resource Stream Protection standards.

9.6.4 CFC shall design and construct storm water discharge facilities entering into wetlands or buffers as percolation or infiltration trenches and discharges to wetland buffers in a dispersed manner consistent with the Process IV Hearing Examiner Decision and as approved by the Director of Public Works.

9.6.5 CFC shall provide, prior to issuance of Building Permit, an Integrated Pest Management Plan as described in the Ecology Stormwater Manual (Ecology 2001). This source control BMP shall outline control of fertilizer and pesticide application, soil erosion, and site debris, and include the use of pesticides/herbicides only as a last resort.

9.7 Wetland Mitigation. CFC shall comply with all conditions contained in the Process IV Hearing Examiner Decision dated April 23, 2004 and attached hereto as Exhibit H.

10. Other Project Review Processes and Minor Modifications.

10.1 Other Project Review Processes. The Project will be subject to building permit review and other applicable review processes. The final design of the buildings and other improvements, precise location of building footprints, location of utilities, determination of access points, and other design issues will be determined during that process and must be consistent with the Agreement.

10.2 Modifications. Minor modifications to the Plan may be approved by the Director of Community Development Services and processed in accordance with FWCC 22-1680. Factors to be considered by the Director of Community Development Services when determining if a modification to the Plan is minor include but are not limited to the following.:

a. Activity changes (excluding change of use of the principal use or expansion of accessory uses as specified herein) or increases in square footage of gross floor area as defined by

FWCC section 22-1 that do not result in significant additional or modified trip generation or distribution.

b. Changes in the location or number of access points that do not impact traffic safety or modify trip distribution.
c. Requests for modification of landscaping pursuant to FWCC 22-1570.
d. Removal of significant trees in conjunction with other actions deemed minor.
e. Addition of fewer than twenty parking stalls outside of areas containing "significant trees" as defined by FWCC.
f. Exterior changes that do not significantly add to or alter approved architectural design.
g. Actions that do not result in impacts to the environment pursuant to the State Environmental Policy Act requiring issuance of a mitigated threshold determination of nonsignificance.
h. Actions that do not require review by the hearing examiner.

A modification is not minor if the Director of Community Development Services determines that there will be substantial changes in the impacts on the neighborhood or the city as a result of the change. Modifications that are not minor modifications are major modifications and shall require City Council approval pursuant to FWCC 22-1680.

11. Waiver and Mutual Release of Claims of Invalidity. The City and CFC acknowledge and represent that the terms of this Agreement have been jointly negotiated and that each party enters into this Agreement voluntarily. Further, CFC and the City agree that this Agreement is authorized under law and each party waives any claim that the Agreement is invalid or illegal. The agreements and representations in this Section are material to this Agreement and are being relied upon by both parties.

12. General Provisions.

12.1 Binding on Successors.

12.1.1 The Agreement shall bind and inure to the benefit of the Parties and their successors in interest, and may be assigned to any successor in interest to the Project property.

12.1.2 This Agreement is intended to protect the value of, and facilitate the use and development of, the Property and to protect the public health, safety, and welfare of the City. Therefore, the covenants set forth herein shall be construed to and do touch and concern the Property and the benefits and burdens inuring to CFC and to the City from this Agreement shall run with the land and shall be binding upon CFC, its heirs, successors, and assigns, and upon the City.

12.2 Governing Law. This Agreement shall be governed by and interpreted in accordance with the laws of the State of Washington. Venue for any action to enforce the terms of this Agreement shall be in King County Superior Court.

12.3 Severability. The provisions of this Agreement are separate and severable. The invalidity of any clause, sentence, paragraph, subdivision, section, or portion or the invalidity of the application thereof to any person or circumstance, shall not affect the validity of the remainder of this Agreement, or the validity of its application to other persons or circumstances.

12.4 Authority. The City and CFC each represents and warrants to the other that it has the respective power and authority, and is duly authorized, to execute and deliver this Agreement and that the persons signing on its behalf are duly authorized to do so. CFC further represents and warrants that it is the fee owner of the Property, that it has authority to agree to the covenants and provisions contained herein, and that there are no other persons, entities, or parties with any fee interest in the Property.

12.5 Amendment. This Agreement may be modified only by written instrument authorized by the City Council and duly executed by the City Manager and CFC, and their successors and assigns consistent with FWCC 22-1679; provided, however, notwithstanding the provisions of this Agreement to the contrary, the City of Federal Way may, without the agreement of CFC, adopt and impose upon the Property restrictions and development regulations different than those set forth herein, if required by a serious threat to public health and safety. Moreover, as provided in Section 5 of the Agreement, five years after the date of the execution of the Agreement, the City may elect, without the agreement of CFC, to apply development regulations in effect at that time to any development within the scope of the Agreement that has not been completed at that time.

12.6 Exhibits. All exhibits attached hereto are incorporated herein by this reference as if fully set forth herein.

12.7 Headings. The headings in this Agreement are inserted for reference only and shall not be construed to expand, limit or otherwise modify the terms and conditions of this Agreement.

12.8 Integration; Scope of Agreement. This Agreement and its exhibits represent the entire agreement of the Parties with respect to the subject matter hereof. There are no other agreements, oral or written, except as expressly set forth herein. This Agreement does not set forth all conditions applicable to the Project to the extent that additional conditions may be imposed as part of any permit issued by the City, as required by the Federal Way City Code as determined by the discretion of the Directors of the Departments of Community Development Services and/or Public Works.

12.9 Enforcement. Subject to the notice and cure provisions of this section, in the event either party fails to satisfy any of its obligations under this Agreement, the other party shall have the right to enforce this Agreement by an action at law for damages or in equity for specific performance. The Parties acknowledge that damages are not an adequate remedy for breach by either party. In addition to the remedies set forth herein, in the event of a breach of this Agreement by CFC, the City may enforce this Agreement under the enforcement provisions of the Federal Way City Code in effect at the time of the breach and/or it may terminate this Agreement and take action to amend the Comprehensive Plan and zoning designation of the Property. No party shall be in default under this Agreement unless it has failed to perform its duties or obligations under this Agreement for a period of thirty (30) days after written notice of default from the other party. A notice of default shall specify the nature of the alleged default and the manner in which the default may be cured. If the nature of the default is such that it cannot be reasonably cured within thirty (30) days, then a party shall not be deemed in default if the party commences a cure within thirty (30) days and, thereafter, diligently pursues completion of the cure.

12.10 Attorneys Fees. In any action brought to enforce this Agreement or for damages resulting from a breach thereof, the prevailing party as determined by the court, shall be entitled to recover its reasonable attorneys' fees.

12.11 Police Power. Nothing in this Agreement shall be construed to diminish, restrict or limit the police powers of the City granted by the Washington State Constitution or by general law. This Agreement is an exercise of the City's police powers, the authority granted under RCW 36.70B.170-.210, and other laws.

12.12 Recording; Assignment. The Agreement shall be recorded with the Real Property Records Division of the King County Records and Elections Department.

12.13 No Third Parties. The Agreement is made and entered into for the benefit of the parties hereto and their successors and assigns. No other person or entity is an intended third party beneficiary. No other person or entity shall have any right of action under this Agreement.

IN WITNESS WHEREOF the parties have hereunto placed their hand and seals on the day and year indicated.

SETTLEMENT AGREEMENT

SETTLEMENT AGREEMENT

THIS AGREEMENT ("Agreement") made this 5th day of February, 1996, by and between the CITY OF FEDERAL WAY, a municipal corporation, hereinafter referred to as "CITY", and FEDERAL WAY INDUSTRIAL PARK, INC., a Washington corporation, hereinafter referred to as "FWIP".

WHEREAS, CITY commenced a Petition for Condemnation in the King County Superior Court under cause #95-2-19577-6; and

WHEREAS, the parties hereto have reached an agreement settling all claims in that condemnation action;

NOW, THEREFORE, THE PARTIES AGREE AS FOLLOWS:

1. The CITY OF FEDERAL WAY shall be granted an irrevocable, exclusive and permanent easement in the form attached hereto as Exhibit "I" and incorporated herein by this reference ("Easement") granting to the City the free and uninterrupted use over, across and through certain real property ("Property") located in Federal Way, King County, Washington and legally described in Exhibit "A" to the Easement. The City's rights shall be exercised upon that portion of the Property legally described in Exhibit "B" to the Easement ("Easement Area.")

2. In consideration of the grant of the Easement by FWIP to the CITY and upon execution of this Agreement and satisfaction of the contingencies set forth in Paragraph 17, the CITY shall pay to FWIP the sum of Five Thousand and no/100 Dollars ($5,000.00) simultaneously with the recording of the Easement.

COPY OF ORIGINAL

Exhibit "II", attached hereto, and by this reference fully incorporated ("Wetland Buffer Area"). The Wetland Buffer Area shall be applicable to all future developments on the Property.

5. FWIP shall be allowed by the CITY to handle storm water retention/detention for any project on the Property, by constructing, in compliance with then-applicable codes (which as of this date are found in the King County Surface Water Design Manual) and at its expense, such conveyance systems as are reasonably necessary to provide for direct gravity flow drainage of storm water from the Property, to the storm water facility which the CITY is constructing on the Easement Area, so as to eliminate the need for storm water retention/detention on those portions of the Property which naturally drain to the Easement Area. FWIP'S right to allow such drainage shall be limited to waters which currently naturally drain to the Easement Area and shall be limited to the initial development of the Property and shall not be extended to any redevelopment of the Property. "Initial development" shall mean the initial development of each phase of all of the Property.

6. The CITY agrees that the Easement Area may, at the option of FWIP, be included in any calculation of open space required for the development of the Property. The Easement Area may, at the option of FWIP, also be included in computing maximum lot coverage for development of the Property. Nothing herein shall relieve FWIP from complying with the City's landscape or other requirements for development.

7. The CITY shall pay all costs related to obtaining approval for and developing the Easement Area, as a storm water

request shall be reasonable in comparison to other similar proposals, such that the request is not used to circumvent the spirit of this provision.

11. CITY staff will support a proposal through lot line imination to combine lot 2 and lot 3 of the short plat recorded nder King County Auditor #8110300869 so as to be considered as one 1) lot for development purposes.

12. CITY staff will support an application by FWIP to extend the parking lot improvements on lot 4 of the short plat recorded under King County Auditor #8110300869 into the Wetland Buffer Area up to the western toe of the slope of the berm forming the western boundary of the retention/detention facility, provided, that appropriate mitigation, determined pursuant to City codes, such as planting on the edge of the berm, is provided by FWIP. To the extent that the City staff requests mitigation for the loss of Wetland Buffer, said request shall be reasonable in comparison to other similar proposals, such that the request is not used to circumvent the spirit of this provision.

13. CITY staff will support a variance, pursuant to City codes, from the required lot size for lot 4 of the short plat recorded under King County Auditor #8110300869 to allow development of building improvements on said lot due to the limitations on the ability to combine lot 4 with other lots of the short plat.

14. CITY staff will support parking lot improvements in the portion of the Wetland Buffer Area south of the roadway of lot 2 of the short plat recorded under Auditor #8110300869 with appropriate mitigation costs, pursuant to City codes, to be provided by FWIP.

17. The obligations under this Agreement are conditioned upon and subject to final approval of this Agreement by the City Council of Federal Way.

18. This Agreement shall constitute the entire agreement between these parties. Any prior understanding or representation of any kind preceding the date of this Agreement shall not be binding on either party except to the extent incorporated in this document.

19. It is agreed that this Agreement will be governed by, construed and enforced in accordance with the Laws of the State of Washington.

20. Any modification of this Agreement or additional obligation assumed by either party in connection with this Agreement shall be binding only if evidenced by a writing signed by each party or an authorized representative of each party.

21. This Agreement may be executed in any number of counterparts, each of which shall be deemed to be an original, but all of which together shall constitute but one and the same instrument.

22. Except as otherwise expressly set forth in this Agreement, the rights and obligations of the parties shall be binding upon and inure to the benefit of their respective successors in interest and assigns.

23. In the event either of the parties defaults on the performance of any terms of this Agreement or either party places the enforcement of this Agreement in the hands of an attorney, or files a lawsuit, each party shall pay all its own attorney's fees,

INC., a Washington corporation, who executed the foregoing ument, and acknowledged the said instrument to be the free and ntary act and deed of said corporation, for the uses and oses therein mentioned, and on oath stated that he was horized to execute the said instrument and that the seal affixed the corporate seal of said corporation.

Witness my hand and official seal hereto affixed the day and year first above written.

PERMANENT/EXCLUSIVE EASEMENT

For and in consideration of One Dollar ($1.00) and other valuable consideration, the receipt of which is hereby acknowledged, Federal Way Industrial Park ("FWIP"), a Washington corporation ("Grantor"), grants, conveys and warrants to the CITY OF FEDERAL WAY, a Washington municipal corporation ("Grantee") for the purposes hereinafter set forth a perpetual, exclusive and permanent easement under, across and over certain real property (the "Property") located in Federal Way, Washington, legally described as follows:

> Legal Description of Property attached hereto as Exhibit "A" and incorporated herein by this reference.

Except as may be otherwise set forth herein, Grantee's rights shall be exercised upon that portion of the Property ("Easement") legally described as follows:

> Legal Description of Easement attached hereto as Exhibit "B" and incorporated herein by this reference.

1. Purpose. Grantee and its agents, designees and/or assigns shall have the perpetual, exclusive and permanent right, without prior notice to Grantor, at such times as deemed necessary by Grantee, to enter upon the Property to inspect, design, construct, reconstruct, operate, maintain, repair, replace, remove, grade, excavate, and enlarge all surface water facilities including, but not limited to, underground facilities and/or systems upon and/or under the Easement, together with all appurtenances thereto, including without limitation, outlet structures, control structures, pipes, catchbasins, manholes, retention and detention facilities, ponds, biofiltration swales, water quality treatment facilities, vaults and ditches ("Facilities"). Following the initial construction of the Facilities, Grantee may from time to time construct such additional facilities or improvements as it may require. Grantee shall have the right to flood the Easement. In addition to the foregoing, Grantee shall have the right to engage in any and all activities as if Grantee owned fee title to the Easement.

2. Access. If reasonable access to the Easement is not otherwise available, Grantee shall have the right of access to the Easement over and across the Property to enable Grantee to exercise its rights hereunder.

3. Obstructions; Landscaping. Grantee may remove any and all vegetation, trees, or other obstructions within the Easement, and may level and grade the Easement.

4. Grantor's Use of Easement. Except as hereafter provided, this Easement shall be exclusive to Grantee; provided, however, Grantor reserves the right to use the Easement in order to comply with City code requirements for open space, greenbelt or maximum lot coverage; provided, however, that such right does not include complying with the City's landscape code or other code requirements. Grantor may install, at its expense and in compliance with all applicable laws, such facilities as are reasonably necessary to provide for direct discharge of storm water from the Property to the Easement after obtaining all necessary permits. Grantor's right to use the Easement for purposes of calculating open space, green belts or maximum lot coverage shall not entitle Grantor to enter upon or disturb the Easement for any reason. Except as necessary to provide drainage facilities from the Property to the Easement, Grantor shall not perform digging, tunnelling or other form of construction activity on the Property, which would disturb the compaction or unearth the Facilities on the Easement, or endanger the lateral support to the Facilities. Grantor shall not blast within fifteen (15) feet of the Easement. Provided further as to the area described as "The East 175.5 feet of the North 30 feet of tract X of King County Short Plat No. 281074 and the South 30 feet of the Easement area of Lot 3 of the Plat," this Easement shall be non-exclusive and Grantor or its successors or assigns may construct a road and connect to existing utilities in said area, if done in compliance with applicable codes.

5. Indemnification. Grantor agrees to waive any and all claims relating to any damage to the Easement, including those resulting from surface water flooding and further to indemnify and hold Grantee, its elected officials, officers, employees, agents, and volunteers harmless from any and all claims, demands, losses, actions and liabilities (including costs and all attorney fees) to or by any and all persons or entities, including, without limitation, their respective agents, licensees, or representatives, arising from, resulting from, or connected with Grantor or Grantor's agents', employees', or invitees' negligent actions.

6. Successors and Assigns. The rights and obligations of the parties shall inure to the benefit of and be binding upon their respective successors in interest, heirs and assigns; provided, however, that Grantor's right to discharge storm water to the Easement shall be limited to waters which currently naturally drain to the Easement and shall only apply to the initial development of the Property and not to any redevelopment of the Property. All such redevelopment will be required to comply with all applicable laws and codes. "Initial development" shall mean the initial development of each phase of all of the Property.

7. No Encumbrances. Grantor shall maintain the Easement free of all encumbrances and defects and is prohibited from recording or taking any action which results in the recording of any lien, encumbrance or other defect against the Easement.

RE: ***Christian Faith Center (City File No. 02-102271-UP)***
Your request dated 5/8/03 concerning drive aisle width and vehicle overhang

Dear Mr. Hulsmann:

City staff have reviewed the above referenced request with the following responses.

Drive aisle width

The Director of Community Development Services will allow the requested 24-foot drive aisle width in place of the city's typical width of 25 feet, but only at locations where the adjacent stall dimensions are 9 feet by 18 feet, irrespective of overhangs. Drive aisles serving compact-sized stalls or reduced-length stalls resulting from overhang allowances must have a 25-foot width. Per city standards, up to 25% of the total stalls on the site may be designated as compact, with a stall dimension of 8 feet by 15 feet (served by a 25 foot drive aisle).

The City will allow the requested 24-foot drive aisles, as described above, on a "demonstration" basis and in the interest of reducing pervious surface and increasing landscaping along with other low impact development techniques the City has recommended and the applicant is considering for the project. It should also be noted that this decision is consistent with the three example codes you submitted, where a 24-foot drive aisle is permitted when adjacent stall dimensions are 9 feet by 18 feet or greater. It is also consistent with parking standards contained in the 1990 handbook of the American Association of State Highways and Transportation Officials (AASHTO).

Vehicle overhang

The requested vehicle overhang into landscaping is already permitted by code and requires no modification. However, per code, wherever a parking stall will be reduced in length by vehicle overhang into landscaping, the required width of the landscaping must be maintained. In addition, any overhang into a sidewalk area must maintain a 5-foot unobstructed sidewalk width. Therefore, the width of landscape areas and sidewalks shall be increased accordingly where necessary to meet this standard. For example, a 2-foot overhang into a required 10-foot landscape strip would require the landscape strip to be increased to a width of 12 feet. Likewise, a 2-foot overhang into a 5-foot sidewalk would require the sidewalk to be increased to a width of 7 feet. Full-sized stalls against required landscaping or a sidewalk must incorporate wheel stops to prevent overhang.

Please let me know if you have any further questions or concerns on these topics.

Sincerely,

Lori Michaelson, AICP
Senior Planner

PROCESS IV REQUEST ENVIRONMENTALLY) FW# 02-1-2271-00-UP
SENSITIVE AREA INTRUSIONS)
)
CHRISTIAN FAITH CENTER)
)

I. SUMMARY OF APPLICATION

The applicant is requesting to: 1) fill a "Category III" wetland and its buffer; 2) mitigate for the filled wetland and buffer by creating wetland and additional buffer area in and adjacent to a "Category II" wetland on the site; 3) displace a portion of a wetland/stream buffer to accommodate an access road; and 4) intrude into wetland buffers for street improvements, including pavement widening, retaining wall, and extending storm pipes and stream culverts.

II. PROCEDURAL INFORMATION

Hearing Date:	April 20, 2004
Decision Date:	April 23, 2004

At the hearing the following presented testimony and evidence:

1. Lori Michaelson, Senior Planner, City of Federal Way
2. Gil Hulsman, 923 Shaw Road, Suite A, Puyallup, WA 98372
3. Garet Monger, 518 N. 59th, Seattle, WA 98103
4. Marie Adair, 28811 – 19th Ave. S., Federal Way, WA 98003

At the hearing the following exhibits were admitted as part of the official record of these proceedings:

1. Staff Report with all attachments
1-E. Addendum to Environmental Impact Statement (1E) (4/16/04)
1-F. Letters from Public (Beginning w/Derek Dexheimen) (1F) (4/16/04)

2. Power Point Presentation (Hard Copy) – Process IV Public Hearing
3. Christian Faith Centers – Wetland Areas Chart
4. Statement from Virginia Marquart
5. Marie Adair Statement

III. FINDINGS

1. The Hearing Examiner has heard testimony, admitted documentary evidence into the record, and taken this matter under advisement.

2. The Community Development Staff Report sets forth general findings, applicable policies and provisions in this matter and is hereby marked as Exhibit "1" and incorporated in its entirety by this reference.

3. All appropriate notices were delivered in accordance with the requirements of the Federal Way City Code (FWCC).

4. The applicant has a possessory ownership interest in a generally rectangular, 46.58-acre parcel of unimproved, mostly forested property located east of Pacific Highway South and west of Interstate 5 between South 336th Street and South 341st Place within the City of Federal Way. The applicant has submitted requests for approval of a comprehensive plan amendment, zone reclassification, development agreement, and development plan which, if approved, would allow development of the site into a 218,500 square-foot church, 104,480 square-foot private school, and associated parking, playfields, and landscaping. The decision to approve or deny the above requests is within the jurisdiction of the Federal Way City Council which will hold a public hearing prior to making such determination.

5. To construct the project as proposed, the applicant must also obtain Process IV approval to allow the applicant to fill a wetland and intrude into wetland/stream buffers. Specifically, the applicant requests authority to fill a Category III wetland and its buffer; create additional wetlands and buffers in and adjacent to an on-site Category II wetland; displace a portion of a wetland/stream buffer to accommodate an access road; and potentially intrude into wetland buffers to make street improvements which could include pavement widening, a retaining wall, and the extension of storm pipes and stream culverts.

6. A north/south trending ridge divides the parcel into two drainage subbasins within the Hylebos Creek Basin. A tributary to the west branch of Hylebos Creek flows

from north to south across the west side of the property, and a tributary to the east branch of Hylebos Creek flows across the east side of the parcel from north to south. The Federal Way City Code (FWCC) defines both tributaries as major streams.

7. Three wetlands exist on the site. Wetland "A" measures approximately 4.5 acres, 14,000 square feet of which are located on the site. Wetland "A" is associated with the Hylebos tributary and also serves as an operating, regional storm drainage detention facility known as "Kitts Corner Pond", designed and maintained by the City. Pursuant to a 1996 Settlement Agreement between the City and a previous property owner, the applicant will discharge stormwater runoff from the western portion of the site into the Kitts Corner Pond (Wetland "A"). However, the primary wetland hydrology is provided by the tributary which flows into Wetland "A" through an 18-inch diameter storm pipe and a pair of 42-inch diameter stream culverts beneath South 336th Street.

8. Pursuant to the Settlement Agreement, the City has provided a permanent buffer width of 100 feet around Wetland "A" with the exception of the northern portion of the boundary adjacent to South 336th Street which ranges in width from approximately 40 feet to 50 feet. The proposed site plan shows an access extending east into the site from Pacific Highway South through the southern portion of the wetland buffer as anticipated by the Settlement Agreement which requires City staff to support such an extension. However, the agreement requires Process IV review and hearing examiner approval. Thus, development of the project will not impact Wetland "A", but will impact the buffer along the south portion of the wetland and could impact a portion of the buffer along the north portion of the wetland.

9. As previously found, a Hylebos Creek tributary flows into the wetland from beneath South 336th Street, exits the site through an adjustable gate spillway in the southwest corner of the pond, and then flows into a storm pipe which passes beneath Pacific Highway South. The tributary has no defined stream channel within Wetland "A" and dries up during the late summer.

10. Wetland "C" consists of a 3,762 square-foot Category III Palustrine scrub-shrub wetland located near the center of the parcel at the proposed location of the school auditorium/sanctuary building. The applicant proposes to fill both the wetland and its required 25-foot wide buffer. Wetland "C" has no hydrological connection to any other water body as its hydrology is provided by a high ground water table. The

wetland has low habitat value due to its size, lack of plant diversity, isolation, and lack of open water during the summer months.

11. Wetland "B", located along the eastern property line, consists of a linear, riparian wetland that is associated with and straddles the eastern Hylebos Creek tributary. The wetland meets the definition of a Category II Palustrine Forested wetland which requires a 100-foot wide buffer. The Hylebos tributary provides hydrology for the wetland as it flows into said wetland through two culverts beneath South 336th Street. Sewer line construction previously disturbed the wetland and buffer. The site plan shows the wetland surrounded by a 100-foot wide buffer with the exception of the north portion adjacent to South 336th Street.

12. To build the project as proposed and make a reasonable use of the property, the applicant must fill Wetland "C" and its buffer. To mitigate therefor, the applicant proposes to intrude into Wetland "B", its buffer, and the tributary buffer to create 5,200 square feet of Category II wetland which will include grading. The applicant must also displace 16,305 square feet of Wetland "A" buffer to facilitate construction of the access road from Pacific Highway South. To mitigate for the displacement, the applicant proposes to create 20,083 square feet of wetland buffer along the eastern border of the existing buffer. The applicant may need to displace an unknown amount of buffers for both Wetlands "A" and "B" adjacent to South 336th Street. The exact area of displacement (if any) will not be known until the City Council makes its determination regarding approval of the project and road improvements. Maximum displacement will include 11,690 square feet of Wetland "A" buffer and 6,794 square feet of Wetland "B" buffer. To mitigate, the applicant will add 21,480 square feet of wetland buffer to the northeast buffer of Wetland "A" and 17,165 square feet of buffer along the western buffer of Wetland "B" (See Exhibit 3).

13. Section 22-1358 FWCC sets forth the criteria an applicant must meet prior to constructing improvements and making land surface modifications within regulated wetlands. Section 22-1359 FWCC sets forth criteria for constructing improvements and land surface modifications within regulated wetland buffers. The first five criteria set forth in each section are identical, but modifications within wetlands have four additional criteria. As previously found, the applicant must fill Wetland "C" and its buffer. Prior to obtaining approval to do so, the applicant must establish that the request satisfies all criteria set forth in Sections 22-1358(d) and 22-1359(f) FWCC. Findings on each criteria are hereby made as follows:

A. Filling the wetland will not adversely affect water quality. The wetland has no hydrologic connection with other wetlands or stream corridors. A code-required final erosion and sedimentation control plan will address adverse water quality impacts related to grading and filling activities. The created wetland and buffer along the eastern tributary will provide much greater functions relating to water quality, hydrology, and wildlife habitat than currently provided by Wetland "C".

B. Filling the wetland and buffer will not adversely affect the quality of wildlife habitat. Wetland "C" has low habitat value due to its small size, hydrologic isolation, lack of plant diversity, and lack of open water during the summer. The compensatory mitigation areas along Wetland "B" will provide habitat values equal to or greater than retention of Wetland "C". No endangered or protected animals inhabit the site.

C. Filling the wetland and buffer will not adversely affect drainage or storm water retention capabilities. The applicant will excavate the mitigation area to ensure a volume of surface water detention and retention equal to Wetland "C".

D. Filling will not lead to unstable earth conditions or create erosion hazards. Wetland "C" is not located near any geologically hazardous areas, and an erosion and sedimentation control plan which the City must approve will address erosion from filling and grading.

E. Filling the wetland will not be materially detrimental to any other property in the area nor to the City as a whole. As previously found, the applicant will create 5,200 square feet of wetland as compared to the 3,762 square feet filled.

F. As previously found, the filling of Wetland "C" will result in no net loss of wetland area, function, or value.

G. The project is in the best interest of the public health, safety, or welfare. As previously found, creating additional wetland and buffer within the valuable stream/wetland area along the east property line results in greater resource protection and will allow more efficient use of land.

H. The applicant has demonstrated sufficient scientific expertise and supervisory capability to carry out the project. The applicant's wetland biologist is a recognized expert with over 10 years experience in designing wetland mitigation plans.

I. The applicant is committed to monitoring the project and making corrections if the project fails to meet projected goals. The applicant has provided a mitigation and monitoring plan for a five-year period and has also designed the storm drainage system to allow further discharge into the wetlands to restore hydrology if such is necessary.

J. The City has approved the applicant's conceptual mitigation plan, and the replacement and enhancement wetland and buffer ratios satisfy the criteria set forth in Section 22-1358(e)(3) FWCC.

15. Prior to obtaining approval to intrude into Wetland "B" and its buffer and the Stream "B" buffer to provide compensatory wetland and buffer for filling Wetland "C" and its buffer, the applicant must also establish that the request satisfies the criteria set forth in Sections 22-1358 and 22-1359 FWCC. Findings on each criteria are hereby made as follows:

A. Intrusion to create additional wetlands will not adversely affect water quality. The created wetland area will have a greater diversity of wetland plants than Wetland "C", and such plants will provide water quality by removing nutrients and toxins by filtration and uptake in plant tissue. Mitigation and monitoring will ensure no adverse impacts to water quality.

B. The intrusion will not adversely affect the existing quality of the wetland's or buffer's wildlife habitat. Habitat potential in the mitigation area of Wetland "B" is greater than the wetland and buffer of Wetland "C". The enhanced native scrub-shrub plant community and native forest habitat will increase the vegetation and plant diversity thereby improving near stream habitat opportunities.

C. The intrusion will not adversely affect drainage or stormwater retention capabilities. The applicant has designed the created wetland to replicate the stormwater retention capacity of Wetland "C". The applicant will excavate the toe of an existing slope and create a volume of surface water detention and retention comparable to or greater than the filled wetland. Creek flood waters, as well as stormwater runoff, will provide a source of hydrology to the new wetland. Project stormwater is infiltrated into the ground will move down slope through the wetland buffer into the created wetland.

D. The intrusion will not lead to unstable earth conditions nor create erosion hazards. The creation area consists of a relatively level flood plain adjacent to the Hylebos tributary. Excavation depth will range from one to three feet, and water velocities, even during winter flooding periods, are relatively slow. The dredging will create no steep slopes or other topography subject to erosion. Extensive revegetation will bind the soil and control erosion.

E. The intrusion will not be materially detrimental to any other property in the area nor to the City as a whole. The project will not affect off-site properties or public or private open space areas.

F. As previously found, the intrusion will result in no net loss of wetland area, function, or value. The applicant is creating more wetland than it is filling in accordance with the requirements of the FWCC. The applicant is also establishing substantially more wetland buffer than destroyed.

G. The project is in the best interest of the public health, safety, or welfare. As previously found, trading a small, isolated wetland for an expanded, connected, wetland system results in greater resource protection and more efficient use of land.

H. As previously found, the applicant has demonstrated sufficient scientific expertise and supervisory capability to fulfill the project.

16. Prior to eliminating a portion of Wetland "A"'s south buffer to allow construction of the access road from Pacific Highway South, the applicant must establish that the request satisfies the criteria set forth in Section 22-1359(f) FWCC, addressing wetland buffers, and Section 22-1312(c) FWCC, addressing intrusion into setbacks for streams. Said Sections set forth the same criteria, but Section 22-1312 FWCC has one additional criteria. Findings on each criteria are hereby made as follows:

A. Locating the access road within the Wetland "A" buffer will not adversely affect water quality. As previously found, Wetland "A", located mostly west and northwest of the site, is known as the "Kitts Corner Pond" and provides a regional storm drainage facility. The applicant's conceptual storm drainage plan (Exhibit L) shows surface water collected from the proposed access road and directed into a storm water treatment system to the south of said road. The water then discharges into Wetland "A" following cleansing.

B. Construction of the road in the buffer will not adversely affect the existing quality of the wetland's or buffer's wildlife habitat. The buffers on the west and south sides of Wetland "A" are presently in poor condition and consist of earthen berms, gravel roadways, and sparse vegetation. However, the eastern buffer consists of forest and is therefore in good condition. The applicant proposes to remove 16,305 square feet of a previously disturbed buffer area and replace it with property adjacent to the high quality, forested buffer on the east side of the wetland. The access road is proposed within an existing access easement and was recognized in the Settlement Agreement.

C. Construction of the road will not adversely affect drainage or stormwater retention capabilities. Construction in accordance with a final storm drainage grading and erosion control plan will assure no adverse impacts to the drainage or stormwater retention capabilities of the buffer.

D. Construction will not lead to unstable earth conditions nor create erosion hazards. The road area contains no geologically hazardous areas, and construction in accordance with approved plans will ensure that no unstable earth conditions or erosion hazards develop.

E. Construction will not be materially detrimental to any other property in the area of the subject property nor to the City as a whole, including loss of open space. Replacement of a disturbed buffer with forested property will benefit the City and properties in the area. The additional buffer will preserve and protect sensitive areas from future land modifications and encroachments by people and animals.

F. Section 22-1312(c)(6) requires the applicant to show that the intrusion is necessary for reasonable development of the subject property. The road will provide access to the site in accordance with an existing easement recognized by the Settlement Agreement. To build the project, the applicant must have an access onto Pacific Highway South. Therefore, the applicant cannot proceed with reasonable development without the road.

17. As previously found, depending on the City Council's requirements for street

improvements on South 336th Street, the applicant may need to intrude into those portions of the buffers of both Wetlands "A" and "B" located within the right-of-way of said road. If the City Council requires full street improvements within the wetland buffer areas, the applicant will need to disturb 11,690 square feet of Wetland "A" buffer and 6,794 square feet of Wetland "B" buffer. The applicant proposes to create 21,480 square feet of buffer for Wetland "A" and 17,165 square feet of buffer for Wetland "B". Thus, the applicant will replace 18,484 square feet of low quality wetland buffer with 38,645 square feet of high quality buffer. Prior to intruding into said wetland buffers to make street improvements, the applicant must establish that the requests satisfies the criteria set forth in Sections 22-1312 and 22-1359 FWCC. The request satisfies said criteria as the applicant must construct improvements to include pavement widening, retaining walls, and extension of storm drainage pipes. The existing location and configuration of South 336th Street plus the required street improvements dictate the street and storm drainage system design for the overall project. All improvements will occur within the right-of-way, and the retaining walls will limit buffer displacement. Both buffers along South 336th Street have been previously disturbed by construction of existing street and drainage improvements but have revegetated over time. As previously noted, a sewer line was constructed within Wetland "B". The wetland buffers within the right-of-way provide no significant habitat value, but must be invaded to provide access to the site. The applicant has also demonstrated that the stream cannot cross beneath South 336th Street in an open condition, and extending the culvert by three feet will have little, discernable effect on stream function or habitat. The existing culvert meets the 100-year storm design standard as will the extensions. The culvert design does not preclude fish passage, although fish do not inhabit either tributary, and are not located immediately down stream.

18. In summary, Wetland "A" will not be disturbed, but will have its buffer area expanded from the present 192,327 square feet to a possible 205,895 square feet, and will also have 3,598 square feet of wetland enhancement. Wetland "C" will be filled and eliminated. Wetland "B" will increase in size by 5,200 square feet and will have its buffer area increased from the present 193,085 square feet to 220,089 square feet. Overall, wetland size will increase from the present 242,971 square feet to 244,410 square feet. Wetland buffers will increase from the present 393,838 square feet to 425,985 square feet (Exhibit 3). Therefore, development of the site as proposed will result in no net loss in wetlands and/or wetland buffers.

19. Prior to obtaining Process IV review approval, the applicant must establish that the request satisfies the criteria set forth in Section 22-445(c) FWCC. Findings on each

criteria are hereby made as follows:

A. All requests are consistent with the Federal Way Comprehensive Plan. Applicable goals and policies set forth in the Plan include Policy CA4 which approves a tradeoff of small, isolated wetlands in exchange for a larger, connected wetland system which can achieve greater resource protection and reduce isolation and fragmentation of habitat. The applicant proposes a development which eliminates a "small, isolated wetland" in exchange for increasing the size of a more valuable, larger, connected wetland system. Policy NEG7 of the Comprehensive Plan encourages the protection and enhancement of the functions and values of the City's wetlands, and the applicant's mitigation plans do so. As previously found, the project meets the City's objective of no overall net loss of wetland functions or values in accordance with Policy NEP43. The mitigation site complies with Policy NEP50 as it contributes to an existing wetland system and increases buffers for existing wetlands.

B. The project is consistent will ~~all~~ applicable provisions and laws of the FWCC assuming compliance with conditions of approval and City Council approval for the overall development.

C. The project is consistent with the public health, safety, and welfare.

D. The City Council will determine whether the streets and utilities in the area are adequate to serve the anticipated demand from the proposal. The wetland mitigation does not generate demand on streets and utilities. Approval of the Process IV request will authorize street frontage improvements within the South 336th Street right-of-way and construction of an access road from Pacific Highway South.

E. The City Council will determine whether the proposed accesses to the parcel are at their optimal location and configuration. Again, the Process IV approval authorizes street improvements and construction as set forth above.

20. The City included a number of comment letters which raised generalized objections regarding the filling of wetlands and intrusion into wetland buffers. However, none of the letters offered expert testimony contradicting the applicant's expert studies and the City's review thereof. The Washington Court of Appeals addressed such

comments in Maranantha Mining v. Pierce County, 59 Wash.App. 795 (1990);

> The only opposing evidence was generalized complaints from displeased citizens. Community displeasure cannot be the basis of a permit denial. 59 Wash.App. 795, at 804.

IV. CONCLUSIONS

From the foregoing findings the Hearing Examiner makes the following conclusions:

1. The Hearing Examiner has jurisdiction to consider and decide the issues presented by this request.

2. The applicant has established that the request to fill a Category III wetland and buffer, mitigate for such activities by providing additional wetlands and buffers, displacing a wetland/stream buffer to accommodate an access road, and intrude into wetland buffers to construct street improvements is consistent with applicable criteria set forth in Sections 22-1358, 22-1359, and 22-1312 FWCC. The project also complies with applicable goals and policies of the Federal Way Comprehensive Plan.

3. The project satisfies all criteria set forth in Section 22-445(c) FWCC for Process IV approval. Therefore, Process IV approval should be granted subject to the following conditions:

    1. As required by the Director of Community Development Services, prior to occupancy of any buildings on the site, the applicant shall set aside the wetlands and buffers approved by this decision as Native Growth Protection Tracts (NGPT's). The boundaries of the areas shall be surveyed and shall reflect the expanded buffers shown in a final approved Mitigation and Monitoring Plan, prepared in accordance with Condition #7 below; and shall be in addition to the buffer area for the east side of Wetland "A" as delineated the 1996 Settlement Agreement between the City of Federal Way and the Federal Way Industrial Park. The applicant shall submit the draft documents for the City's review and authorization and the documents shall be recorded as directed by the City.

    2. As required by the Directors of Community Development Services Department and Public Works Department, prior to issuance of any

construction permits, the applicant shall field-flag all identified wetland buffer boundaries in accordance with a final approved Mitigation Plan, prepared in accordance with Condition #7 below; and consistent with the recorded Native Growth Protection Tracts as required by Condition #1 above; and the buffer boundaries shall be reflected on all applicable construction drawings and permits.

3. As required by the Director of Community Development Services, prior to issuance of a building permit, the applicant shall submit for the City's review and approve a plan to provide signage on the site, identifying environmentally sensitive areas and prohibiting human and pet access into such areas. The plan shall include the number, location, and design details, including text, for the proposed signs.

4. Any use of the recreational field adjacent to Wetland "B" for competitive athletic games, such as baseball or soccer, as may be approved by the Director of Community Development Services, must provide fencing adjacent to the sports field along the west Wetland "B" buffer boundary, delineated pursuant to Condition #1 above. Prior to initiation of any such activities, the applicant shall establish the fencing pursuant to the City's review and approval of a fencing plan and design details as provided by the applicant, and such fencing shall be designed to allow for the passage of small animals.

5. As required by the Director of Community Development Services pursuant to FWCC § 22-1358(1)(g) and § 22-1358(3)(4), prior to issuance of construction permits related to any work approved with this application, the applicant shall: (a) provide a cost estimate that covers the complete costs for plant materials, installation, and maintenance, including contingencies, pursuant to the final approved Mitigation Plan; (b) provide a performance and maintenance bond to the City in the amount of 120 percent of the cost estimate; and (c) pay for the services of a qualified professional selected and retained by the City to review monitoring reports, conduct inspections, and make recommendations to the City during monitoring period. Following successful installation of the wetland mitigation work pursuant to the final approved Plan and initial inspection, the performance portion of the bond shall be released and the five-year maintenance portion of the bond shall apply during the five years of monitoring.

6. As required by the Director of Public Works, grading and clearing activities in the Wetland "B" mitigation area (excluding installation of planting and an irrigation system) shall be prohibited between October 1st and April 30th.

7. Prior to issuance of any construction permits, the applicant shall submit a final Mitigation and Monitoring Plan, for the City's review and approval, that addresses all outstanding requirements as identified in the April 8, 2004, memorandum from Sheldon and Associates, Inc.

8. The Process IV approval does not take effect unless or until the City Council approves the Comprehensive Plan Amendment, Rezone, Development Agreement, and Development Plan, as separately requested by the applicant.

DECISION:

The request for Process IV approval to allow the filling of Wetland "C", the mitigation for the filled wetland and buffer by the creation of wetland and additional buffer area in an and adjacent to Wetland "B"; the displacement of a portion of a wetland/stream buffer to accommodate an access road; and the intrusion into wetland buffers for street improvements is hereby granted subject to the conditions contained in the conclusions above.

DATED THIS 23rd DAY OF April, 2004.

STEPHEN K. CAUSSEAUX, JR.
Hearing Examiner

TRANSMITTED THIS 23rd DAY OF April, 2004, to the following:

PROCESS IV

Rights to Appeal

Decisions of the hearing Examiner may be appealed by any person who is to receive a copy of that decision under FWCC Section 22-443.

The appeal, in the form of a letter of appeal, must be delivered to the Department of Community Development Services within fourteen (14) calendar days after the issuance of the Hearing Examiner's decision. The letter of appeal must contain:

2. A statement identifying the decision being appealed, along with a copy of the decision;

3. A statement of the alleged errors in the Hearing Examiner's decision, including specific factual finds and conclusions of the Hearing Examiner disputed by the person filing the appeal; and

4. The appellant's name, address, telephone number and fax number, and any other information to facilitate communications with the appellant.

The person filing the appeal shall include, with the letter of appeal, the fee established by the City of the costs of preparing a written transcript of the hearing (or in the alternative, the appellant may prepare the transcript at his or her sole costs from tapes of the hearing provided by the City).The appeal will not be accepted unless it is accompanied by the required fee and cost (or agreement of the appellant to prepare the transcript).

Appeals from the decision of the Hearing Examiner will be heard by The City Council. The decision of City Council is the final decision of the City.

The action of the City in granting or denying an application under this article may be reviewed pursuant to RCW 36.70C in the King County Superior Court. The Land Use Petition must be filed within twenty-one (21) calendar days after the final land use decision of the City.

EXHIBIT D

STATEMENT OF FACTS AND CONCLUSIONS

1. The applicant has a possessory ownership interest in a generally rectangular parcel of unimproved property located east of Pacific Highway South and west of Interstate 5 (I-5) between South 336th Street and South 341st Place within the City of Federal Way.

2. The subject site currently has a comprehensive plan and zoning designation of Business Park (BP) and the land is presently vacant. Existing zoning and land uses of the surrounding properties in the vicinity include single and multiple family to the north; a mix of residential, commercial, and industrial to the south; commercial to the west, and Interstate 5 and commercial to the east.

3. The applicant has submitted requests for approval of a comprehensive plan amendment and rezone, with an associated development agreement and development plan to allow development of the site into a 218,500 square-foot church, 101,526 square-foot private school, and associated parking, playfields, and accessory uses.

4. The requested Comprehensive Plan Amendment and Rezone is subject to a City Council decision pursuant to *Federal Way City Code* (FWCC) Chapter 22, Article IX, "Process VI Review;" and the requested Development Agreement and Development Plan is subject to City Council decision pursuant to FWCC Chapter 22, Article IX, "Process VI Review," and FWCC Chapter 22, Article XXI, "Development Agreements." The decision to approve or deny the requests is within the jurisdiction of the Federal Way City Council.

5. The City Council held a Public Hearing May 24, 2004 and June 15, 2004, took testimony, admitted evidence into the record, and considered the matter fully.

6. All appropriate procedures were followed in accordance with the requirements of the FWCC and applicable law.

7. All appropriate notices were delivered in accordance with the requirements of the FWCC and applicable law.

8. The Hearing Examiner reviewed and conditionally approved the environmentally sensitive areas requests associated with the application on April 23, 2004. The Hearing Examiner Decision sets forth general findings, applicable policies and provisions in the matter and is hereby incorporated in its entirety, without limitation, by this reference.

9. Pursuant to the State Environmental Policy Act (SEPA), the City issued a Notice of Adoption of Existing Environmental Documents and Issuance of a Determination of Nonsignificance, on the proposed Comprehensive Plan Amendment and Rezone of the site from Business Park (BP) to Multifamily Residential 3600 (RM-3600) on July 4, 2001. The City issued Draft and Final Environmental Impact Statements (EIS) for the development application on November 18, 2003, and March 3, 2004, and EIS Addenda on April 16, 2004 and May 21, 2004. Four public meetings were conducted during the environmental review process for the proposed project. These included an EIS Scoping Meeting on August 27, 2002; Neighborhood Traffic Meeting on May 8, 2003; Draft

Environmental Impact Statement (DEIS) hearing on December 12, 2003; and City Council EIS briefing on March 15, 2004. The Threshold Determination, EIS and addenda, and all environmental documents for the project, are hereby incorporated in their entirety, without limitation, by this reference.

10. The Staff Report sets forth general findings, applicable policies and provisions in the matter and is hereby incorporated in its entirety, without limitation, by this reference.

11. Pursuant to FWCC Section 22-1660, "Purpose," development agreements associated with a comprehensive plan designation and related zoning change may be used at the City Council's discretion, where the project is larger in scope and has potentially larger impacts than normal, or where the City Council may desire to place certain restrictions on the proposal. The intent of a development agreement is not to waive requirements normally associated with a proposed use. A "Concomitant Agreement and Development Agreement", herein called "The Agreement" or "The Development Agreement," has been prepared for the project in order to fully address and mitigate identified impacts associated with the project. The Concomitant Agreement allows for a rezone of the property subject to conditions governing the use of the property. Under the Concomitant Agreement, the allowable use of the property shall be limited to a church, a school, and accessory uses. Pursuant to FWCC Section 22-1662, "Content," the Agreement sets forth the development standards and other provisions that apply to and govern and vest the development, use, and mitigation of the development of the real property for the duration specified in the Agreement, consistent with the applicable City of Federal Way development regulations. The Agreement is accompanied by a Development Plan (*Exhibit B* to the Agreement) as required by FWCC Section 22-1669, and has been prepared in accordance with FWCC Section 22-1664, "Preparation of Development Agreement."

12. Mitigation measures established in the Agreement are based on the FWCC and adopted regulations, policies and procedures; *Federal Way Comprehensive Plan* (FWCP); the EIS prepared for the project, including the key development and operational assumptions underlying the EIS analysis; and the City's police power authority.

13. Mitigation measures established in the Agreement are proportional to direct, identified impacts of the development and are supported by substantial evidence.

14. The proposed principal uses of the site as a church and school, are allowed uses in the proposed Multifamily Residential (RM) zoning districts, pursuant to FWCC Sections 22-671 and 22-674, subject to all applicable development regulations and standards. Use and development of the site consistent with the FWCC and the Development Agreement will help ensure compatibility of the use with surrounding areas.

15. The project will provide a "front yard" setback from South 336th Street of a minimum 50 feet; with "side" and "rear" yards of 30 feet for the church building; and 50 feet for the school building, ball fields and any playground equipment. This provides an additional 20 feet more of front yard setback from South 336th Street for the church building than would be required by FWCC Sections 22-671 and 22-674, which allows additional landscape screening against South 336th Street and residential zoning districts to the north of the site. In addition, pursuant to code-required parking setbacks and design guidelines, a 15-foot parking lot setback along church portion with landscape buffer will be provided along the south property line adjacent to the residential uses to the south.

16. Consistent with FWCC Sections 22-671 and 22-674, the maximum allowed height of single-story elements of the church building is 35 feet above average building elevation (ABE), with up to three additional feet allowed for articulated cornices, and the maximum second-story height for offices, classrooms, library, and similar uses is 40 feet above ABE. The maximum height of the school building is 40 feet above ABE, with up to three additional feet allowed for articulated cornices. The maximum height of the sanctuary portion of the church, and the gymnasium portion of the school auditorium, is 55 feet ABE.

17. Pursuant to FWCC Section 22-1669, "Development Plan," and FWCC Section 22-395, "Director's Decision", the site and architectural design elements of the project were approved in a March 20, 2004, Director's Design Decision, based on the analysis and findings contained in *Exhibit A* to the decision. Development of the site in accordance with the design decision and other conditions of project approval and required mitigation will ensure incorporation of good design principles and compatibility with surrounding areas. The design decision sets forth general findings, applicable policies, and provisions, and is hereby incorporated in its entirety, without limitation, by this reference.

18. The applicant's preliminary clearing, grading, erosion control, significant tree survey, landscape, and surface water drainage plans have been reviewed and accepted under applicable City of Federal Way adopted codes, policies, and regulations, including FWCC Chapter 21, "Surface Water Management"; FWCC Chapter 22, Article XVII, "Landscaping"; and the *King County Surface Water Design Manual* (KCSWDM) and the City's amendments to the KCSWDM, subject to review of final construction plans prepared in accordance with all applicable codes and development standards; the EIS; Process IV conditions of approval; and mitigation required under the Development Agreement.

19. Surface water detention and water quality treatment facilities will be provided for both the west and east drainage sub-basins on the site, in accordance with all applicable design and development regulations.

20. The Development Agreement establishes a number of mitigation measures that meet or exceed code requirements. This includes the oversight of a Construction Site Erosion and Sediment Control (ESC) Supervisor; a Stormwater Pollution Prevention Plan; a phased construction plan; and seasonal construction limits. Surface water mitigation in the Agreement includes design and construction of the east side stormwater detention pond to meet Level 2 flow control standards; collection and dispersement of roof runoff from the sanctuary roof to adjacent wetland buffer areas; design and construction of surface water treatment facilities for the East and West 1 sub-catchments to include the use of Stormwater Management filter vault systems, with compost medium, that meets or exceeds Resource Stream Protection Standards; and provision of an Integrated Pest Management Plan as described in the *Department of Ecology Stormwater Manual* (2001), in order to control the use of fertilizers and pesticides. The Agreement also provides for denser vegetated bank cover and larger trees around surface water detention water quality treatment ponds than would otherwise be required by code. Additional vegetated cover will contribute to water quality by decreasing the temperature of surface water runoff from impervious surfaces and standing water in drainage facilities. This will help mitigate stormwater drainage impacts from the development.

21. Perimeter landscape buffers, as specified in the Development Agreement, meet or exceed the applicable standards in FWCC Section 22-1566, "Multifamily Residential, RM." This includes 50 feet of landscaping along South 336th Street; 20 feet along other public rights-of-way and access easements; 15 feet along other property lines associated with the church; and 10 feet along other

property lines associated with the school. These provisions are consistent with the FWCC, and also provide 20 feet of additional landscaping along South 336th Street than required by code. A 50 foot vegetated landscape buffer along South 336th Street will preserve additional native trees and shrubs and preserve a cross-site vegetated corridor linking to on-site wetland and stream buffers and riparian areas along the East Branch Hylebos Creek. In addition to retaining native vegetation and providing habitat opportunity, this corridor will provide water quality functions such as rainwater interception and filtering.

22. The clearing, grading, surface water, and landscaping mitigation provided in the Development Agreement is consistent with goals and policies contained in the FWCP Natural Environment Chapter, including NEG1, NEG2, NEG3, NEG10, NEP1, NEP2, NEP7, NEP 10, NEP18, NEP21, NEP63, and NEP64.

23. Pursuant to FWCC Sections 22-1671, 22-1674, and 22-1378, the required amount of parking for churches and schools is determined on a case-by-case basis, pursuant to a parking demand analysis. Based on the City's review of the applicant's Traffic Management Plan (TMP), the Development Agreement specifies a minimum of 1,406 parking stalls and a maximum of 1,540 stalls on the site to serve anticipated parking demand for ordinary operation of the site. The Agreement also requires the applicant to prepare and submit an overflow parking plan for review and approval to the Public Works Director prior to special events to manage overflow parking using resources such as transit, shuttle service, and traffic control such as flaggers and police officers. The Agreement establishes the parking setbacks from property lines, consistent with FWCC Sections 22-671 and 22-674.

24. Lakehaven Utility District has provided Certificates of Water and Sewer Availability for the property, and will provide these services pursuant to developer extension agreements between the applicant and District. Fire and emergency medical services will be provided by the Federal Way Fire Department. A City-operated regional storm drainage detention pond located in the northwest portion of the site has been determined to have adequate capacity to accommodate site drainage from the westerly sub-basin on the property.

25. Staff has reviewed and analyzed transportation related matters. The Staff Report sets forth general findings, applicable policies, and provisions related to the matter, and is hereby incorporated in its entirety, without limitation, by this reference.

26. The project site has frontage on the existing rights-of-way of South 336th Street, SR 99 (Pacific Highway South), South 341st Place, and the planned extension of 20th Avenue South, as shown in FWCP Map III-5. Pursuant to FWCC Section 22-1474(a), frontage improvements are required for these roadways.

27. South 336th Street is classified as a minor arterial, as shown in FWCP Map III-5. FWCP Map III-6 classifies South 336th Street as a Type K street. FWCP Map III-19 was revised to relocate the segment of a bicycle route on South 336th Street between 13th Place South and 20th Avenue South to South 330th Street. Therefore, a Type K street is no longer applicable to South 336th Street west of 20th Avenue South; a Type M street is now the appropriate standard. Existing improvements on the frontage consist of 36 to 54 feet of pavement with intermittent curb, gutter, and sidewalk on the north side only. Existing right-of-way width varies from 60 to 100 feet. The applicant will dedicate five feet of right-of-way on the west 400 feet of frontage only and construct the required half-street improvements on the entire frontage. Modifications approved by the Director of Public Works may be made pursuant to FWCC Section 22-1477, in order to minimize impacts to wetlands and wetland buffers.

28. SR 99 (Pacific Highway South) is classified as a principal arterial, as shown in FWCP Map III-5. FWCP Map III-6 classifies SR 99 as a Type A street. SR 99 is currently under construction to provide full standard improvements, and all necessary right-of-way has been acquired.

29. Twentieth Avenue South is classified as a minor collector, as shown in FWCP Map III-5. FWCP Map III-6 classifies 20th Avenue South as a Type R street. As a new street through the site, the applicant will dedicate all 66 feet of right-of-way and construct full street improvements.

30. South 341st Place is classified as a minor collector, as shown in FWCP Map III-5. FWCP Map III-6 classifies South 341st Place as a Type R street. Existing improvements consist of a 36-foot street with curbs and gutters, and five-foot sidewalks in a 60-foot right-of-way. The applicant will dedicate an additional three feet of right-of-way. Pursuant to FWCC Section 22-1477, the requirement for street frontage improvements on South 341st Place are waived because the improvements are already in place.

31. Pursuant to FWCC Section 22-1474(b), the City may require up to 300 square feet of right-of-way dedication per average daily trip generated. According to the EIS, average daily trip generation would exceed 2688 trips, thus allowing the City to require at a minimum 806,486 square feet of right-of-way dedication. Approximately 108,290 square feet of right-of-way dedication would be required to meet full standards. Thus, the right-of-way requirements are proportionate with the level of impact.

32. Pursuant to FWCC Section 22-1542, two-lane driveways shall be 30 feet wide, and three-lane driveways shall be 40 feet wide, unless design vehicles (the largest vehicle that would reasonably be expected to use the driveway, and therefore the one to which the driveway will be designed) require larger widths. The EIS analyzed all driveways as two-lane except for the northerly of the four driveways onto 20th Avenue South, and the driveway onto South 336th Street, which were assumed to be three-lane driveways.

33. Pursuant to FWCC Section 22-1543(a), South 336th Street has an access classification of four, which allows access points with spacing of 150 feet measured centerline-to-centerline. FWCC Section 22-1543(c) limits access to one per 330 feet of frontage. South 336th Street has approximately 2150 feet of frontage, thus six access points could be allowed. The site plan for the project shows one access approximately 572 feet west of 20th Avenue South. A single-family residential driveway is located opposite this proposed driveway, the driveway to the Ridgecrest Motel is located approximately 100 feet to the west, and a driveway to a multi-family residential complex is located 230 feet to the east. The spacing standard does not apply to single-family residential uses. If the driveway were to be relocated to the east, it would worsen the intersection sight distance for traffic turning left from the driveway onto westbound South 336th Street. If the driveway were relocated to the west, it would infringe upon wetland buffer. The Ridgecrest Motel consists of eight units. Based on ITE *Trip Generation*, 6th edition, the motel is estimated to generate four trips the morning, evening, and Saturday peak hours, and three trips during the Sunday peak hour; therefore, although this access does not meet spacing standards, it has a low probability of creating a significant safety issue. City staff will monitor.

34. Pursuant to FWCC Section 22-1543(a), SR 99 has an access classification of one, which, due to its status as a state highway, must meet the Washington State Department of Transportation (WSDOT) standard of 250 feet. Left-turn in access would best be allowed at a spacing of 330 feet, and full access is permitted only at signalized intersections. However, FWCC Section 22-1543(c) limits

access to one per 330 feet of frontage. The site has approximately 534 feet of frontage; therefore, only one access point would be permitted. The project proposes to provide a right-in/right-out access 749 feet south of South 336th Street, which would be shared with Pacifica Plaza. This location has no other access within 250 feet. Therefore, this access meets driveway spacing standards.

35. Pursuant to FWCC Section 22-1543(b), the access spacing standard for 20th Avenue South would be 150 feet. Each of the proposed driveways meets this standard. However, FWCC Section 22-1543(c) limits access to one per 330 feet of frontage. Twentieth Avenue South has 1662 feet of frontage, thus five access points could be allowed, whereas four are proposed. Therefore, this standard is met.

36. Pursuant to FWCC Section 22-1543(b), the access spacing standard for South 341st Place would be 150 feet. FWCC Section 22-1543(c) limits access to one per 330 feet of frontage. No access points are proposed onto South 341st Place. However, the creation of the intersection of 20th Avenue South and South 341st Place creates access spacing issues with an existing driveway at the intersection of 21st Avenue South and South 341st Place. As part of engineering plan review, the applicant will provide plans that provide adequate intersection sight distance, geometrics, and traffic control measures that provide for safe and efficient operation of the intersection consistent with FWCC and adopted standards.

37. Pursuant to TIA Guidelines item VI.D.4.a, the City uses *Highway Research Record 211* to determine when left-turn lanes are warranted at unsignalized intersections. A left-turn lane is warranted when certain thresholds involving travel speeds, left-turn volumes, through volumes in the same direction as the subject left-turn, and opposing traffic volumes are exceeded.

38. Based on the volumes in the traffic analysis for the EIS, this warrant is met at the driveway on westbound South 336th Street during the morning, afternoon, and evening peak hours. Therefore, the applicant will provide a westbound left-turn lane at the site access on South 336th Street.

39. Based on the volumes in the traffic analysis for the EIS, left-turn lane warrants are met at the north driveway on northbound 20th Avenue South during the morning, and Sunday between service peaks; at the north central driveway on southbound 20th Avenue South during the morning, afternoon, Sunday between service, and Sunday after service peaks; at the south central driveway on northbound 20th Avenue South during the morning, and Sunday between service peaks; at the south central driveway on southbound 20th Avenue South during the Sunday between service peak; at the south driveway on southbound 20th Avenue South during the Sunday between service and after service peaks; and at the south driveway on northbound 20th Avenue South during the Sunday between service peak. Since left-turn lanes are warranted at each driveway, the applicant will stripe 20th Avenue South to provide a two-way left-turn lane throughout the site.

40. The proposed schedule of activities contained in the Traffic Management Plan (TMP), required pursuant to FWCC Section 22-671, was analyzed in the environmental review. Pursuant to FWCP Policies TP5, TP45, and TP62, the following restrictions on the scheduling of activities will be placed on the development in order to reduce traffic impacts: school classes will be completed by 3:30 pm; Sunday services will be separated by at least 90 minutes; evening services will be scheduled to start no earlier than 6:30 pm; Dominion College will have no classes scheduled between noon and 6:30 pm; and special events will be reviewed on a case-by-case basis pursuant to the TMP and should be scheduled to not add trips during peak hours of other uses, or conversely, other uses should be canceled to accommodate the special events. Should a modification of this

schedule of activities, which was submitted for review in the EIS, be required, the Agreement specifies the applicable code process to use.

41. The intersection of SR 99 at South 312th Street would fail the adopted Level of Service (LOS) standards in 2007 with or without Christian Faith Center (CFC). This intersection was originally included in the study area based on a 10 evening peak hour trip threshold in the City's *Guidelines for the Preparation of Transportation Impact Analyses*. As a result of the initial analysis, CFC modified their proposed hours of operation to reduce evening peak hour trip generation. As a result, the project now impacts this intersection by eight evening peak hour trips, less than the 10-trip threshold. Therefore, no mitigation is required at this intersection.

42. Pursuant to the methodology analyzed in the EIS, the intersection of South 320th Street and 23rd Avenue South fails the adopted LOS standard during the evening peak hour in 2007, with or without the project, and fails as a result of the project during the Sunday peak. Staff considered other methodologies for determining failure of the adopted LOS standard without violating the adopted policy. In practice, City staff has administered the policy as outlined in the TIA guidelines as the worst of two tests. Table 2 defines a volume/capacity ratio test as X_c (as defined in the *Highway Capacity Manual*) must be less than 1.000. However, item V.B. in the TIA Guidelines specifies that no movement shall have a volume/capacity ratio greater than 1.000. It is this latter standard upon which the EIS identified the LOS failure. Using X_c, the volume /capacity ratio is 0.91 during the 2007 evening peak hour and 0.94 during the Sunday peak hour. Given that using X_c is consistent with FWCP Policy TP16, and the high cost to mitigate relative to the impact, no mitigation will be required at this intersection.

43. The intersection of South 336th Street at 1st Way South would fail the LOS standards during the evening peak hour in 2007 with or without the project. The proposed mitigation would provide a protected right turn overlap phase for westbound traffic during the southbound left-turn phase. This is a minor revision to the signal design and will be incorporated into the capital project at this location, which is scheduled to be in design in 2004. No mitigation will be required at this intersection beyond pro-rata share contributions described in the Agreement.

44. The intersection of 16th Avenue South at South 341st Place would fail the LOS standard during all peak hours analyzed as a result of the project. The project would add 426 trips during the morning peak hour, 344 trips during the afternoon peak hour, 99 trips during the evening peak hour, and 820 trips during the Sunday peak hour. Because of its proximity to the signalized intersection of 16th Avenue South and SR 99, it is impractical to signalize this intersection to resolve the LOS failure.

45. The EIS considered three alternatives to resolve the LOS failure at 16th Avenue South and South 341st Place. One assumes that the capacity restriction will resolve itself by drivers rerouting to avoid making the left-turn from westbound South 341st Place to southbound 16th Avenue South, by rerouting to South 336th Street and SR 99 when leaving the site, called the "Capacity Constrained Distribution" in the EIS. The second is to provide a connection between South 341st Place and South 344th Street, and use planned signalized intersections on South 344th Street at 16th Avenue South and SR 99 to access these roadways. The third alternative considered is to prohibit westbound left-turns from South 341st Place to southbound 16th Avenue South and accommodate U-turns by constructing a roundabout at the intersection of SR 99 and 16th Avenue South. Based on staff analysis, alternatives one and three are not recommended.

46. The "Capacity Constrained Distribution" assumes that due to significant delays encountered when attempting to make a westbound left-turn from S 341st Place to 16th Avenue S, drivers would

become frustrated and learn to use alternate routes. The EIS analysis assumed that most of these trips would leave the site to the north onto S 336th Street, and most would head west on S 336th Street to SR 99 and turn left to 16th Avenue S or continue straight on SR 99. Although no capacity improvements appear warranted as a result of this assignment, staff has significant concerns about the safety of the 16th Avenue S / S 341st Place intersection under this scenario. It has been the City's experience that unsignalized intersections operating near capacity have a higher than average collision rate. This is due primarily to increased driver frustration, leading to drivers choosing gaps in opposing traffic that are inadequate to complete the maneuver safely. Therefore, this alternative is not recommended.

47. The roundabout alternative would provide adequate levels of service. In order to accommodate planned traffic volumes, it would have a 3-lane roundabout with an inscribed diameter of 200 feet. As SR 99 is a state highway, any intersection modifications would have to be approved by WSDOT. To date, WSDOT has not approved any three-lane roundabouts on the state highway system, and its historical reluctance to approve 2-lane roundabouts casts doubt as to whether this would be a viable alternative at this time. In addition, a roundabout would need right-of-way on both sides of SR 99, impacting developed properties on the east side of SR 99. Therefore, this alternative is not recommended.

48. Providing a connection between South 341st Place and South 344th Street reroutes traffic around the intersection of 16th Avenue South and South 341st Place, and takes advantage of a project planned by the City to construct traffic signals on South 344th Street at 16th Avenue South and at SR 99.

49. Potential locations to provide this connection between South 341st Place and South 344th Street are 21st Avenue South and 18th Avenue South. Due to the presence of wetlands, three different alignments for 21st Avenue South were considered in the EIS. An alignment along the existing right-of-way would impact wetlands and result in two stream crossings; an alignment to the east would cross the wetland at its narrowest width, but would still impact wetlands and result in two stream crossings; and an alignment to the west would avoid impacting the stream and wetlands, but would require right-of-way acquisition from the truck parking lot.

50. Eighteenth Avenue South has continuous right-of-way, but is not a through street due to an existing temporary berm. Eighteenth Avenue South provides a preferred alternative to 21st Avenue South due to the wetlands in the vicinity of the proposed 21st Avenue South alignments and the transitional nature of the residential neighborhood on 18th Avenue South. Pursuant to FWCC Section 22-1477, the required right-of-way width may be modified by the Director of Public Works to avoid right-of-way acquisition and lessen the impact to the neighborhood, and utility undergrounding will not be required. Therefore, the applicant will construct 18th Avenue South as a modified street section between the southern extent of the street improvements in Kits Corner Business Park and South 344th Street.

51. The rerouting of trips using this connection on 18th Avenue South would add 417 trips to the east leg of South 344th Street east of 16th Avenue South, and 128 trips between 16th Avenue South and SR 99 during the Sunday after service peak hour. Both of these intersections are currently unsignalized. The addition of these trips would create LOS failure and safety issues associated with unsignalized intersections operating over capacity. Staff has determined that these intersections would not operate safely if the project's trips impacted these intersections prior to the completion of the Transportation Improvement Plan (TIP) project scheduled for 2008 that would add left-turn lanes on South 344th Street and signalize both intersections. Therefore, the applicant will construct traffic signals at these intersections.

52. Staff analysis has determined that the project's trips meet warrants for left-turn lanes in the westbound direction at both the intersections of SR99 and 16th Avenue S and S 344th Street and 16th Avenue S. Eastbound left-turn lanes may also be needed to line up lanes across the intersections within allowable tapers, depending on the intersection geometrics; this will be determined through engineering plan review of these intersections. Although the EIS identifies impacts related to right-of-way acquisition in order to provide full-standard improvements, it is not necessary to provide full street improvements to mitigate the safety and LOS deficiencies at these intersections. The applicant will be required to develop a design that mitigates the safety and LOS impacts while minimizing right-of-way acquisition. The applicant will provide signalization and westbound left-turn lanes necessary to assure the safe operation of these intersections in the interim. Signal interconnect will also be provided between the two signalized intersections. The need for eastbound and westbound left-turn lanes will be determined during engineering plan review. The requirement for any of the left-turn lanes on South 344th Street may be waived by the Public Works Director if it is determined that to do so would require right-of-way acquisition.

53. The intersection of 16th Avenue South/Enchanted Parkway South (SR 161) at South 348th Street (SR 18) fails the adopted LOS standard during the school afternoon peak and the Sunday peak with or without the project. The project would add 150 trips during the school afternoon peak hour and 328 trips during the Sunday peak hour. The EIS identifies the construction of a second northbound right-turn lane as a mitigation measure that would correct the LOS deficiency during the school afternoon peak by improving the LOS from F to D, and reducing the LOS deficiency significantly during the Sunday peak hour by reducing the volume/capacity ratio from 1.24 to 1.04. This mitigation measure is in addition to the project in the adopted 2004-2009 TIP, which would add a third westbound left-turn lane and eastbound and westbound right-turn lanes. Based on the traffic analysis for the EIS, in order to function without being blocked by queues in the through lanes, the right-turn lanes would need to provide 550 feet of storage. Therefore, the applicant will pay $350,000 to expand the scope of the City's existing project to add the construction of a second right-turn lane with 550 feet of storage.

54. WSDOT is proposing to construct a major revision to the I-5/SR 18 interchange, which would include access between SR 161 and I-5 to and from the north. This would provide an alternative route that would reduce traffic volumes through the intersection of SR 18 and SR 161. Therefore, it is unknown at this time what intersection configuration will be needed over the longer term at SR 18 and SR 161. Consequently, the addition of through lanes northbound that would be needed to meet the LOS standard in 2007 may not be needed after 2012.

55. The intersection at 20th Avenue South at the south central site access fails the adopted LOS standard during the Sunday after service peak as a result of the project. It is impacted by 1047 Sunday peak hour trips. The EIS addressed four options for addressing the LOS failure: provision of a two-way left-turn lane on 20th Avenue South, construction of a roundabout, signalization, and flagging the driveway during peak hours. Provision of a two-way left-turn lane is recommended to accommodate turning movement volumes, but does not fully mitigate the LOS deficiency. Left-turn volumes from 20th Avenue South into the driveways are high enough that the two-way left-turn lane would not be available for use as a refuge area for vehicles turning left from driveways onto 20th Avenue South. Flagger control during the project's peaks would safely manage traffic only when it is needed. CFC has proposed this option in the TMP. Given the low volumes of through traffic on 20th Avenue South during the project's peak hours of trip generation on Sundays, and the relative lack of impacts by the use of flagger control compared to the other alternatives, flagger control is the recommended mitigation for this location. The applicant will provide flagger control of this

driveway during Sunday peak hours, subject to conditions of the Right-of-Way Activity Permit to be issued by the Department of Public Works.

56. The EIS suggests as a mitigation measure to minimize the intrusion of project-generated traffic into residential neighborhoods to the north of the site an education program to influence route choices by notices, announcements, and new member orientation used to educate drivers. Pursuant to FWCP Policy TP5, the applicant will provide an ongoing education program to minimize traffic intrusion into adjacent residential neighborhoods.

57. The EIS discusses a broad range of traffic calming tools that might be used to discourage through traffic from using 20th Avenue South north of the site, and to maintain reasonable speeds for a residential neighborhood for those that do choose to use 20th Avenue South. Based on the analysis of the alternatives by staff, a through movement diverter is recommended and will be placed at the intersection of 20th Avenue South and South 336th Street, and is intended to prohibit through movements on 20th Avenue South across South 336th Street. All other movements at the intersection would be permitted. The design will accommodate transit turning movements and full access for emergency vehicles, making it possible that smaller vehicles could still drive around the diverter.

58. Despite the diverter, some project-generated traffic may still be expected to use 20th Avenue South to the north of the site. Therefore, there is still some need to discourage the use of 20th Avenue South through traffic calming north of the site, even with the through movement diverter. Traffic circles have been found by many agencies to significantly reduce intersection collisions and slightly reduce midblock vehicle speeds. In order to be effective at reducing speeds and encourage yielding behavior, deflection of the driver's path upon entry to the traffic circle is required. At a three-legged intersection such as at South 332nd Street, additional pavement widening may be required to provide for adequate deflection and provide positive guidance to the driver. In no case should additional right-of-way be required. Pursuant to FWCP Policy TP5, the applicant will place the through movement diverter at the intersection at South 336th Street, and yield-controlled traffic circles at South 330th Street and South 332nd Street to reduce intersection collisions and midblock vehicle speeds.

59. Neighborhood Traffic Meetings were held June 3, 2004 and June 25, 2004 with the residents on 18th Avenue South to determine the best solution for improving 18th Avenue South. Based on the discussions at the meetings, the residential segment of 18th Avenue South will be improved to a modified street section, consisting of 24 foot wide street with vertical curb and gutter, 5-foot sidewalks and 2 additional street lights mounted on existing power poles. Traffic calming elements will be installed, including two speed humps, 1 crosswalk, bulb outs at the intersection of 18th Avenue S and S 341st Street and 18th Avenue S and S 344th Street to narrow the throat width of 18th Avenue S to 20 feet, and street signage to address no through truck traffic, children playing, speed humps, crosswalk and speed limit will be installed.

60. The EIS discusses the potential advantage of extending the code-required frontage improvements on the south side of South 336th Street to provide pedestrian access to transit and the sidewalk network on SR 99. The intersection of SR 99 and South 336th Street is served by Metro Route 182 and Pierce Transit Routes 402 and 500. The City's project on SR 99 will provide transit amenities at the bus stops at this intersection. These improvements could be provided at little additional expense and would connect to one of the best-served transit corridors in the City. Therefore, pursuant to FWCP Policies TP62, TP65, and TP77, the applicant shall provide sidewalk on the south side of South 336th Street to be extended from the west property line of the site to SR 99.

61. The EIS discusses the provision of transit amenities such as shelters, benches, bus landing pads, etc. as a potential mitigation measure. The site is served by Pierce Transit Route 501 at a bus stop located on the south side of South 336th Street east of 20th Avenue South, and a bus stop located on the east side of 20th Avenue South north of South 336th Street. Sidewalks will be provided to the bus zone by code-required frontage improvements on South 336th Street. Pursuant to FWCP Policies TP62, TP65, and TP77, the applicant will provide a transit shelter (if requested by King County Metro or Pierce Transit), shelter footing, litter receptacle pad, bus landing pad, and bench, designed to King County Metro standards, located by City staff in consultation with King County Metro and Pierce Transit staff on the north side of South 336th Street east of 20th Avenue South, and on the east side of 20th Avenue South north of South 336th Street. In addition, the sidewalk will be extended on the east side of 20th Avenue South from the intersection of South 336th Street to this latter bus zone. This will help mitigate increased vehicle trips from the project.

62. The EIS addresses pro-rata share mitigation for impacts to capital projects listed on the City's TIP based on the specific project generated trips. The calculation of pro-rata contributions is described in the TIA Guidelines item VI.D. In general, the pro-rata contribution is the number of evening peak project-generated trips divided by the total evening peak hour traffic with the project multiplied by the estimated cost of the TIP project. Pursuant to FWCC Section 22-1475 and FWCP Policy TP62, the applicant shall either construct the impacted TIP projects or pay $235,900 as a pro-rata mitigation payment for impacts to projects in the 2004-2009 TIP, as identified in the Agreement.

63. The project impacts a capital project in unincorporated King County at the intersection of South 320th Street and Military Road S. Therefore, the applicant will pay King County $647 as a pro-rata share mitigation payment for impacts to the County project.

64. The development proposal includes signalization of the intersection of 20th Avenue South and South 336th Street. This intersection meets *Manual on Uniform Traffic Control Devices* (MUTCD) warrants for signalization under existing conditions; thus the proposal is consistent with FWCC Section 22-1476. The MUTCD also recommends that traffic signals within one-half mile of each other be able to be coordinated. This intersection is one-quarter mile east of the signalized intersection of SR 99 and South 336th Street. FWCP Map III-3 shows that these facilities were planned to have signal communications available between them. Pursuant to FWCP Policy TP39, the applicant will provide signal interconnect on South 336th Street between SR 99 and 20th Avenue South.

65. Based on the traffic analysis in the EIS, left-turn lanes on South 336th Street are warranted during all weekday peak hours analyzed eastbound, and during all peak hours analyzed westbound. In order to provide the left-turn lanes, the existing westbound shoulder could be restriped as a through lane. However, this would eliminate the safe walking route for school children to reach a school bus stop on 20th Avenue South from South Garden Court and Green Crest Villas condominiums. Therefore, the applicant will provide continuous sidewalk improvements on the north side of South 336th Street between South Garden Court and Green Crest Villas to provide a safe walking route to the bus stop.

66. The TIA guidelines adopt the use of an article, *Guidelines for Right-Turn Treatments at Signalized Intersections,* for determining the need for right-turn lanes at signalized intersections. Based on the traffic analysis in the EIS, right-turn lanes are warranted on all legs of the intersection of 20th Avenue South and South 336th Street. In conjunction with the through movement diverter, no through lanes on 20th Avenue South would be required. Thus, no additional widening would be

necessary on the south leg of the intersection. On the north leg of the intersection, the right-turn lane would have to have a vehicle storage length of 175 feet to function effectively. A right-turn lane on the west leg of the intersection would require additional right-of-way dedication from the project, and would have to provide 100 feet of storage to function effectively. Per WSDOT Design Manual Figure 910-14, right-turn lanes would also require 50-foot tapers. The applicant shall construct improvements to the intersection of 20th Avenue South at South 336th Street that provide signalization; signal interconnect on South 336th Street between SR 99 and 20th Avenue South; left-turn lanes on all legs of the intersection and an eastbound right turn lane with 100 feet of storage; a southbound right-turn lane that provides 175 feet of storage; the diverter island that would prohibit through movements on 20th Avenue South. These improvements mitigate the project impacts by providing adequate levels of service at the intersection, while discouraging project-generated traffic from impacting residential neighborhoods north of the site.

67. Based on the traffic analysis in the EIS, under the worst case queuing, the westbound left-turn lane at the intersection of SR 99 and South 336th Street would need a storage length of 450 feet. The existing storage available is 100 feet. The increase in storage length, combined with associated tapers per WSDOT Standard Plan H-3, would overlap the taper necessary to accommodate the left-turn lane at the site driveway onto South 336th Street. Therefore, pursuant to FWCC Section 22-1475, the applicant will provide a continuous left-turn lane between SR 99 and 20th Avenue South.

68. New traffic signals are proposed at the intersections of 20th Avenue South at South 336th Street, 16th Avenue South at South 344th Street, and SR 99 at South 344th Street. In addition, the project would significantly alter travel patterns before and after Sunday services. New signal coordination timing plans would need to be developed to accommodate safe and efficient travel in the project vicinity. Pursuant to FWCP Policy TP39, the applicant will develop timing plans for Sunday peak hours of the development at SR 99 at South 324th Street, SR 99 at South 330th Street, SR 99 at South 336th Street, 20th Avenue South at South 336th Street, 16th Avenue South at SR 99, 16th Avenue South at South 344th Street, and SR 161 at SR 18.

69. Transportation mitigation provided in the Development Agreement is consistent with goals and policies contained in the FWCP Transportation Chapter, including TP5, TP10, TP14, TP16, TP20, TP21, TP23, TP30, TP38, TP39, TP45, TP47, TP62, TP65, and TP77.

70. FWCC Section 22-1671 sets out factors to be considered for a development agreement. The City may consider, but is not limited to, the following factors when considering a development agreement: 1) compatibility with and impact on adjacent land uses and surrounding neighborhoods; 2) adequacy of and impact on community facilities including utilities, roads, public transportation, parks, recreation, and schools; 3) potential benefits of the proposal to the community; and 4) effect upon other aspects of the comprehensive plan.

71. Development of the site in accordance with all adopted City codes, policies, regulations, conditions of approval, and mitigation contained in the Development Agreement, will address project-related impacts and ensure compatibility with adjacent land uses and surrounding neighborhoods. Transportation impacts to surrounding neighborhoods will be addressed by code-required street frontage improvements and mitigation established in the development agreement, including additional street and sidewalk connections; a new street through the site; traffic calming measures such as traffic circles and island diverters; signalization; transit shelter improvements; signal timing plans; traffic management plan; and operational parameters governing use of the site. Conditions of the Hearing Examiner's Process IV decision will ensure that project-related impacts to on site wetlands, streams, and buffers are addressed. Mitigation in the Development Agreement pertaining

to clearing, grading, and landscaping, will further address construction and development-related impacts. The Director's Design Decision also ensures quality design standards and project aesthetics for compatibility with surrounding neighborhoods. Additionally, the use of the property as a church and school is more compatible with the surrounding neighborhoods than the types of uses allowed under BP zoning. Therefore, development of the site in accordance with all adopted City codes, policies, regulations, and conditions of approval, and mitigation contained in the Development Agreement is compatible with, and will not adversely impact, adjacent land uses and surrounding neighborhoods.

72. Development of the site in accordance with all City codes, policies, and regulations and conditions of approval and mitigation contained in the Development Agreement will ensure adequacy of, and address impacts to, community facilities including roads, public transportation, parks, recreation, and schools. Potential transportation-related impacts to adjacent street and the City transportation system were considered in the EIS. Mitigation for these impacts included in the Development Agreement, pursuant to City Code and the EIS, includes system improvements such as construction and dedication of 20th Avenue South through the site, connecting and improving 18th Avenue South, frontage improvements, signalizing of intersections, and traffic calming measures and transit improvements. Driveway and street access to the site was reviewed and determined to be at the optimal location and configuration, subject to the City's adopted design standards and street plans. The recreational needs of the school and day care students will be met on site by the code-required outdoor play areas, and the play field. The minimum amount of outdoor play area included in the Development Agreement meets and exceeds the requirements of the City of Federal Way and the State Superintendent of Public Instruction. In addition, users of the site may utilize City parks in the area. Any such use is expected to be small. The proposed development contains a private school.

73. The proposed church and school are expected to generate employment opportunities and potential economic and social benefits. Based on information provided by CFC, it would employ 120 employees. CFC hosts several major conferences each year, including the Vision Conference attracting 2,500 – 3,000 visitors each March, and a women's conference attracting approximately 2,000 visitors each November. CFC also participates in foreign exchange programs and estimates approximately fifteen to twenty percent of its students are from foreign countries. Employees, members of the congregation, and others who come for services, meetings, and school, may also patronize local merchants and service providers such as retail, restaurants, hotels, and entertainment. Therefore, more economic benefit would be anticipated than is currently generated by the existing vacant site. Additionally, CFC proposes several commercial activities on the site, including latte stands and bookstores, which are expected to generate revenue. As proposed and as required, the project will construct needed right-of-way improvements on and off site, including a new fully-improved City street through the site; street frontage improvements including curbs, gutter, sidewalk, street trees, street lights, and a bike lane; and other street improvements identified in the Development Agreement. Such improvements will promote safe and effective vehicle and pedestrian circulation on the site and in the immediate vicinity. In addition, the project will convert a large, vacant site that has historically been unused to a development that meets all City code requirements for landscaping, lighting, pedestrian amenities, site surveillance, and architectural design principles. CFC will provide educational opportunities through a school and college. It will provide recreation fields and a venue for special events within the City. Conditions contained in the Development Agreement will ensure mitigation of adverse impacts to on-site environmentally sensitive areas resulting from the development. Also, religious organizations typically operate or participate in various local social service-related programs such as food and clothing banks, Youth programs, and counseling, from which the community may benefit. Therefore, development of the site in accordance with all City codes, policies, regulations, and conditions of approval and

mitigation contained in the Development Agreement will provide potential benefits to the community.

74. Development of the site in accordance with all City codes, policies, and regulations and conditions of approval and mitigation contained in the Development Agreement will have no negative impact upon any other aspects of the comprehensive plan. The vision of the FWCP is to provide a supply of land for such uses as services, employment, parks, open space, and housing to meet future demand. If developed as proposed, the Project will provide land for services, employment, and recreational areas. The BP zone is that zone intended for industrial uses including manufacturing and warehousing. The July 2000 Market Analysis concluded that there would be a low demand for BP-zoned land. Therefore, the reduction in BP zoned land, resulting from changing the designation of this site from Business Park to Multiple Family will not affect the vision of the comprehensive plan.

75. FWCC Sections 22-529 (incorporating 22-448(c) by reference) and 22-530 set forth the factors that may be considered for a site-specific comprehensive plan amendment and associated rezone, and the criteria for such amendments. The City may consider, but is not limited to, the following factors when considering a proposed amendment to the comprehensive plan: the effect upon the physical environment; the effect on open space, streams, and lakes; the compatibility with and impact on adjacent land uses and surrounding neighborhoods; the adequacy of and impact on community facilities including utilities, roads, public transportation, parks, recreation, and schools; the benefit to the neighborhood, City, and region; the quantity and location of land planned for the proposed land use type and density and the demand for such land; the current and projected population density in the area; and the effect upon other aspects of the comprehensive plan. In order to encourage efficient and desired development and redevelopment of existing land designated and zoned for various types of commercial uses, when considering proposals for comprehensive plan amendments and rezones from one commercial designation to another, the City will consider development trends in commercially zones areas, market demand for various types of commercial land, and amount of vacant commercial land. For site-specific comprehensive plan amendments, the provisions of FWCC Section 22-488(c) shall also apply.

76. FWCC Section 22-488 established the following rezone criteria that must be considered. The proposed rezone is in the best interest of the residents of the City; and the proposed rezone is appropriate because either: 1) conditions in the immediate vicinity of the subject property have so significantly changed since the property was given its present zoning and that, under those changed conditions, a rezone is within the public interest; or 2) the rezone will correct a zone classification or zone boundary that was inappropriate when established; it is consistent with the comprehensive plan; it is consistent with all applicable provisions of the chapter, including those adopted by reference from the comprehensive plan; and it is consistent with the public health, safety, and welfare; and the proposed project complies with this chapter in all respects; and the site plan of the proposed project is designed to minimize all adverse impacts on the developed properties in the immediate vicinity of the subject property; and the site plan is designed to minimize impacts upon the public services and utilities; and the rezone has merit and value for the community as a whole.

77. The requested comprehensive plan amendment and rezone, from BP to RM 3600, would not in itself affect the physical environment if approved. It would result in changes to the comprehensive plan map and zoning map. Pursuant to the proposed Development Agreement, development of the site would be limited to two buildings with associated parking and recreational and athletic fields. One building would consist of a church sanctuary, school auditorium, and approved accessory uses, and the other building would be used as a private school. An evaluation of potential impacts to the

physical environment as a result of the development of the site as proposed was conducted in an EIS. If the property is developed in accordance with all applicable adopted City codes, policies, regulations, and mitigation contained in the proposed Development Agreement, impacts to the physical environment will be mitigated.

78. The site contains environmentally sensitive areas, as studied in the EIS, including regulated wetlands and streams and their buffers. The Hearing Examiner has approved certain intrusions into these areas, subject to City Council decisions on the comprehensive plan amendment, rezone, development agreement and development plan, in order to construct the project as proposed. Activities approved by the Examiner include filling a Category III wetland and its buffer, and related mitigation including a created wetland and additional buffer area in and adjacent to a Category II wetland on the site. Additional intrusions into wetland and stream buffer were approved in order to accommodate an access road and construct required right-of-way and related improvements including pavement widening, retaining walls, and extending storm pipes and stream culverts. Construction of the site in accordance with all conditions of the Hearing Examiner's decision will result in no net loss of wetlands and wetland buffers and stream buffers. In addition, pursuant to the Hearing Examiner's conditions of approval, all on site wetlands, streams, and their required buffers will be set aside and recorded as Native Growth Protection Easements or Tracts and permanently protected from any future land modifications or intrusions. In addition, the Development Agreement establishes mitigation pertaining to surface water drainage detention and water quality treatment that meets and exceeds code requirements. No lakes are present on the site. If the property is developed in accordance with all applicable adopted City codes, policies, regulations, and mitigation contained in the Hearing Examiner Decision and proposed Development Agreement, impacts on open space, streams and lakes will be mitigated.

79. The request for a change in comprehensive plan designation and zoning from BP to RM 3600 zoning (one unit per 3,600 square feet) is accompanied by a proposed Concomitant Agreement and Development Agreement, which contains a variety of mitigation measures related to site use and operation, transportation, parking, landscaping, and surface water drainage, designed to ensure compatibility with adjacent land uses and surrounding neighborhoods. In addition, rezoning the site from industrial to multifamily with a church and school development would be more compatible with residentially-zoned properties in the area than uses that may develop under the current industrial zoning, such as a warehousing facility with associated truck traffic. If the property is developed in accordance with all applicable adopted City codes, policies, regulations, and mitigation contained in the proposed Development Agreement, the development will be compatible with adjacent land uses and surrounding neighborhoods, and impacts on adjacent land uses and surrounding neighborhoods will be mitigated.

80. Development of the site as proposed, in accordance with all applicable codes, policies, regulations, conditions of approval, and mitigation measures contained in the Development Agreement, will ensure the adequacy of, and mitigate impacts on, roads, public transportation, parks, recreation, and schools.

81. The July 2000 Market Analysis concluded that there would be only an 11 to 13 percent demand for BP-zoned land in the 2000 to 2020 period. Therefore, it is possible that this land would not develop for BP uses in the near future. Conversion of the vacant site from vacant property, which is unlikely to develop in the near future, to a developed site as proposed, in accordance with all applicable codes, policies, regulations, conditions of approval, and mitigation measures contained in the Development Agreement, will be a benefit to the neighborhood, City, and region.

82. Due to the size of its existing congregation, school, and accessory uses such as administrative offices, Dominion College, day care, and future projections for growth, the CFC would like to locate on an approximate 50-acre parcel. Based on a survey of the King County Assessor's records conducted by City staff, there are only two vacant parcels in the City that are 25 acres or more in size. One of these is the parcel under discussion and the other one is the subject of Kits Corner request, located south of South 336th Street and west of Pacific Highway. The July 2000 Market Analysis concluded that there would be only an 11 to 13 percent demand for BP-zoned land in the 2000 to 2020 period. Therefore, it is possible that this land would not develop for BP uses in the near future and a comprehensive plan change and rezone to multiple family zoning and development of the site as proposed, in accordance with all applicable codes, policies, regulations, conditions of approval, and mitigation measures contained in the Development Agreement, will provide the quantity and location of land necessary for the proposed land use, density, and demand for such use.

83. If this site were developed today as warehousing under the existing BP zoning, it would generate approximately 268 employees. Based on information provided by the CFC, if the request for a multiple family designation was granted, and the facility was constructed as proposed, it would employ 120 employees. If the comprehensive plan and rezone is approved pursuant to the proposed Concomitant Agreement and Development Agreement, the use of the site is limited to the proposed church and school and permitted accessory uses, and it will not generate housing units. Rezoning of this site to allow development as a church and school will not impact the City's ability to meet required housing targets mandated under the Growth Management Act (GMA). Therefore, the proposal will not impact current and projected population density in the area.

84. There will not be any adverse impacts upon any other aspect of the comprehensive plan as a result of the proposed change from industrial zoning to multifamily zoning, pursuant to an approved Concomitant Agreement and Development Agreement. The vision of the comprehensive plan is to provide a supply of land for such uses as services, employment, parking, open space, and housing, to meet future demand. The BP zone is that zone intended for industrial uses, including manufacturing and warehousing. One of the reasons that the July 2000 Market Analysis was prepared was to determine whether the City has a 20-year supply of adequately zoned land to meet future demand. The Market Analysis concluded that there would be a low (11-13 percent) demand for BP-zoned land within the 20-year horizon. Therefore, changing the designation of this site from BP to multiple family will not affect the vision of the comprehensive plan of providing an adequate supply of land to meet future demand.

85. As described Findings 77 through 84 above, the requested comprehensive plan amendment and rezone as mitigated does not adversely impact the physical or natural environment; surrounding properties; the adequacy of community facilities; population; or the comprehensive plan; including the supply of and demand for BP-zoned property in the City. Therefore, the rezone is in the best interests of the residents of the City.

86. The City of Federal Way incorporated in February 1990. At that time, the parcels proposed for development by CFC had a mix of multi-family zoning on the west and light manufacturing zoning on the east. Upon incorporation, the City of Federal Way zoned the parcels Manufacturing Park (MP). This was changed to Business Park (BP) in 1995. Properties to the north across South 336th Street have developed as multi-family in recent years. However, very little BP zoned land has developed in this area. Additionally, the July 2000 Market Study found that there would be only an 11 to 13 percent demand for BP-zoned land in the 2000 to 2020 period. As a result, rezoning this property is appropriate and in the public interest, to allow its development rather than remaining

vacant, while at the same time maintaining an adequate supply of industrial zoned property to meet the anticipated demand.

87. The criterion that the rezone will correct a zone classification or zone boundary that was inappropriate when established is not applicable.

88. The requested rezone from BP to RM-3600 does not conflict with the vision of the comprehensive plan to accommodate industrial uses, such as warehousing and manufacturing, in BP zones located on both sides of SR-99 in the vicinity south of South 336th Street, with other BP nodes located around South 272nd Street and South 348th Street. As noted in Finding 84 above, the requested comprehensive plan change and rezone will not decrease the City's supply of BP-zoned property commensurate with the anticipated demand. Rezoning and development of the site pursuant to all applicable adopted City codes, policies, regulations, conditions of approval, and mitigation contained in the proposed Development Agreement, will ensure consistency with the comprehensive plan.

89. If the request is granted, use and development of the site must comply with all applicable provisions of this "chapter" (FWCC) and all applicable adopted regulations; Process IV conditions of approval; mitigation; and the FWCP. Furthermore, a comprehensive plan amendment from BP to multiple family and associated rezone is required for the property to be developed as a church and school. Therefore, the requested rezone, if approved and developed pursuant to all applicable adopted City codes, policies, regulations, conditions of approval, and mitigation contained in the proposed Development Agreement, will be consistent with the comprehensive plan and the "chapter".

90. The requested comprehensive plan amendment and rezone has been analyzed and determined to be consistent with the FWCC and adopted regulations; and the FWCP, and is therefore consistent with the public health, safety, and welfare.

91. Based on Findings 86 through 90, the criteria in FWCC Section 22-488(c)(1)a-e) are met.

92. The proposed development has been reviewed pursuant to all applicable provisions of this chapter (FWCC), and as proposed and as conditioned, it complies with this chapter in all respects.

93. The use of a Concomitant Agreement and Development Agreement enables the City to limit the use of the site to a church, school, and approved accessory uses. As described in Findings 77 through 84, the Development Agreement has been crafted to minimize adverse impacts on the developed properties in the immediate vicinity. Examples include, but are not limited to, requiring a larger buffer along South 336th Street, limiting the enrollment of the school and Dominion College, and restricting the scheduling of activities, such as requiring school classes to be completed by 3:30 p.m. and not scheduling special events that add trips during peak hours of other uses. The site plan of the proposed project is designed to minimize all adverse impacts on the developed properties in the immediate vicinity of the subject property.

94. All public services and utilities are available and adequate to serve the proposed development. Lakehaven Utility District has provided Certificates of Water and Sewer Availability for the site, and will provide these services pursuant to developer extension agreements between the applicant and District. Fire and emergency medical services will be provided by the Federal Way Fire Department. A City-operated regional storm drainage detention pond located in the northwest portion of the site has been determined to have sufficient capacity to accommodate surface water

drainage from the westerly sub-basin of the proposed development. The applicant will provide storm drainage detention facilities for the easterly sub-basin on the site in accordance with the FWCC and Development Agreement. Surface water drainage mitigation contained in the Development Agreement provides a higher standard of water quality treatment for both the East and West Sub-basins on the site, and a higher standard of detention on the East Sub-basin, than would otherwise be required by code. The site plan is designed to minimize impacts upon public services and utilities.

95. Rezoning of this site from BP to multiple family has merit and value for the community as a whole because it will allow development of a site that has not yet been developed and may not develop under the current zoning based on the City's Market Analysis, it supports Growth Management Act goals and policies for urban development, and for the reasons stated in Finding 73.

96. The proposed comprehensive plan amendment has been analyzed and determined to be consistent with the FWCC and FWCP, and therefore bears a substantial relationship to public health, safety, or welfare.

97. The requested comprehensive plan amendment, rezone, and development of the site as a church and school pursuant to the proposed Development Agreement, is expected to generate some benefits to the community, including employment opportunities, development of a previously undeveloped site, potential economic benefit to local shopping areas, restaurants, and hotels; and provision of social services such as food and clothing banks, and youth programs, and counseling programs, as discussed in Finding 73. Therefore, the proposed amendment is in the best interest of the residents of the City.

98. RCW Chapter 36.70A, the *Growth Management Act*, requires the City of Federal Way to adopt and implement a comprehensive plan and to amend it in a timely manner, but no more than once a year, except under certain circumstances. The City is responding to this mandate by updating the comprehensive plan. FWCP Page IV-7 (Economic Development), recognizes that there has been no substantive BP development since the City's incorporation, which suggests the influence of market forces outside of the City limits, where cheaper land and established industrial parks act as a draw for prospective park development. Therefore, the change in comprehensive plan designation and zoning of this site from BP to multiple family will not reduce the supply of BP-zoned property below what is necessary, and will enable development consistent with the economic development vision in the plan. The proposal is consistent with FWCP Economic Development Policies EDP11, EDP22, and EDP23, related to bringing in new jobs to the community, developing cultural and recreational opportunities, and encouraging the development of new multi-purpose facilities in order to increase the number of visitors to Federal Way and resultant visitor spending. The proposed amendment is, therefore, consistent with the requirements of RCW 36.70A and with the portion of the City's adopted plan not affected by the amendment.

99. As addressed in the staff report, the proposed comprehensive plan amendment and rezone have been reviewed and determined to be consistent with all applicable decisional criteria contained in the FWCC, and with the applicable goals and policies contained in the FWCP.

100. As addressed in the staff report, the Development Agreement and Development Plan have been reviewed and determined to be consistent with all applicable decisional criteria contained in the FWCC, and with the applicable goals and policies contained in the FWCP.

9.2.4 School Hours. School classes shall be completed no later than 3:30 p.m. daily.

9.2.5 Holiday Services/Special Events. Holiday services and special events shall be scheduled consistent with the approved Traffic Management Plan (TMP) required by 9.4.12 and consistent with 9.1.4.4.

9.3 Construction Mitigation.

9.3.1 Erosion Sediment Control. CFC shall designate and provide an onsite Erosion Sediment Control (ESC) Supervisor approved by the Director of Public Works, who possesses a Construction Site Erosion and Sediment Control Certification by the Washington State Department of Transportation (WSDOT). This ESC Supervisor shall be available for the duration of the project. The qualifications and responsibilities of the ESC Supervisor are outlined in the 1998 King County Surface Water Design Manual (KCSWDM) and City of Federal Way Addendum. The Director of Public Works may further limit clearing and grading activities on the site based on recommendations from the ESC Supervisor and requirements of the KCSWDM.

9.3.2 Stormwater Pollution Prevention Plan. A construction Stormwater Pollution Prevention Plan (SWPPP) shall be provided by CFC and reviewed and approved by the Director of Public Works prior to issuance of any construction permits or authorizations. Construction phasing shall be included in this plan. CFC has proposed several BMP's which shall be captured in the SWPP plan including, but not limited to, confining refueling and equipment maintenance to a hard-surface staging area with spill containment features and a spill clean-up kit, and pipe slope drains used to convey storm water over steep slopes.

9.3.3 Clearing and Grading. Clearing and grading shall be allowed only pursuant to a phased construction plan approved by the Director of Public Works. Clearing and grading shall occur only between May 1 and September 30 unless otherwise approved by the Director of Public Works.

9.4 Traffic Mitigation. CFC shall perform, as part of Project construction and prior to issuance of certificate of occupancy unless otherwise noted, the following traffic mitigation as required and approved by the Director of Public Works.

9.4.1 CFC shall reconstruct 18th Avenue South from the existing berm to S 344th Street to a ~~Type R street~~modified street section, consisting of ~~40~~ 24 foot wide street with vertical curb~~s,~~ and gutters, ~~4 foot planter strips with street trees, 6~~5-foot sidewalks, and two additional street lights mounted on existing power poles, ~~and traffic calming elements, in a 60 foot right of way,~~ consistent with the attached Exhibit G-1. Traffic calming elements shall be installed, including 2 speed humps, 1 crosswalk, bulb outs at the intersection of 18th Avenue South and S 341st Street and 18th Avenue South and S 344th Street to narrow the throat width of 18th Avenue South to 20 feet, and street signage shall be installed to address no through truck traffic, children playing, speed humps, crosswalk and speed limit.

9.4.2 CFC shall improve S 344th Street from 16th Avenue S to 18th Avenue S consistent with the attached Exhibit G-2. Construction shall consist of Type R Street. The north become frustrated and learn to use alternate routes. The EIS analysis assumed that most of these trips would leave the site to the north onto S 336th Street, and most would head west on S 336th Street to SR 99 and turn left to 16th Avenue S or continue straight on SR 99. Although no capacity improvements appear warranted as a result of this assignment, staff has significant concerns about the safety of the 16th Avenue S / S 341st Place intersection under this scenario. It has been the City's experience that unsignalized intersections operating near capacity have a higher than average collision rate. This is due primarily to increased driver frustration, leading to drivers choosing gaps in opposing traffic that are inadequate to complete the maneuver safely. Therefore, this alternative is not recommended.

47. The roundabout alternative would provide adequate levels of service. In order to accommodate planned traffic volumes, it would have a 3-lane roundabout with an inscribed diameter of 200 feet. As SR 99 is a state highway, any intersection modifications would have to be approved by WSDOT. To date, WSDOT has not approved any three-lane roundabouts on the state highway system, and its historical reluctance to approve 2-lane roundabouts casts doubt as to whether this would be a viable alternative at this time. In addition, a roundabout would need right-of-way on both sides of SR 99, impacting developed properties on the east side of SR 99. Therefore, this alternative is not recommended.

48. Providing a connection between South 341st Place and South 344th Street reroutes traffic around the intersection of 16th Avenue South and South 341st Place, and takes advantage of a project planned by the City to construct traffic signals on South 344th Street at 16th Avenue South and at SR 99.

49. Potential locations to provide this connection between South 341st Place and South 344th Street are 21st Avenue South and 18th Avenue South. Due to the presence of wetlands, three different alignments for 21st Avenue South were considered in the EIS. An alignment along the existing right-of-way would impact wetlands and result in two stream crossings; an alignment to the east would cross the wetland at its narrowest width, but would still impact wetlands and result in two stream crossings; and an alignment to the west would avoid impacting the stream and wetlands, but would require right-of-way acquisition from the truck parking lot.

50. Eighteenth Avenue South has continuous right-of-way, but is not a through street due to an existing temporary berm. Eighteenth Avenue South provides a preferred alternative to 21st Avenue South due to the wetlands in the vicinity of the proposed 21st Avenue South alignments and the transitional nature of the residential neighborhood on 18th Avenue South. ~~Pursuant to the FWCC, the applicant will construct 18th Avenue South as a Type R street between the southern extent of the street improvements in Kits Corner Business Park and South 344th Street.~~ Pursuant to FWCC Section 22-1477, the required right-of-way width may be modified by the Director of Public Works to avoid right-of-way acquisition and lessen the impact to the neighborhood, and utility undergrounding will not be required. Therefore, the applicant will construct 18th Avenue South as a modified street section between the southern extent of the street improvements in Kits Corner Business Park and South 344th Street.

51. The rerouting of trips using this connection on 18th Avenue South would add 417 trips to the east leg of South 344th Street east of 16th Avenue South, and 128 trips between 16th Avenue South and SR 99 during the Sunday after service peak hour. Both of these intersections are currently unsignalized. The addition of these trips would create LOS failure and safety issues associated with unsignalized intersections operating over capacity. Staff has determined that these intersections would not operate safely if the project's trips impacted these intersections prior to the completion of the Transportation Improvement Plan (TIP) project scheduled for 2008 that would add left-turn

lack of impacts by the use of flagger control compared to the other alternatives, flagger control is the recommended mitigation for this location. The applicant will provide flagger control of this driveway during Sunday peak hours, subject to conditions of the Right-of-Way Activity Permit to be issued by the Department of Public Works.

56. The EIS suggests as a mitigation measure to minimize the intrusion of project-generated traffic into residential neighborhoods to the north of the site an education program to influence route choices by notices, announcements, and new member orientation used to educate drivers. Pursuant to FWCP Policy TP5, the applicant will provide an ongoing education program to minimize traffic intrusion into adjacent residential neighborhoods.

57. The EIS discusses a broad range of traffic calming tools that might be used to discourage through traffic from using 20th Avenue South north of the site, and to maintain reasonable speeds for a residential neighborhood for those that do choose to use 20th Avenue South. Based on the analysis of the alternatives by staff, a through movement diverter is recommended and will be placed at the intersection of 20th Avenue South and South 336th Street, and is intended to prohibit through movements on 20th Avenue South across South 336th Street. All other movements at the intersection would be permitted. The design will accommodate transit turning movements and full access for emergency vehicles, making it possible that smaller vehicles could still drive around the diverter.

58. Despite the diverter, some project-generated traffic may still be expected to use 20th Avenue South to the north of the site. Therefore, there is still some need to discourage the use of 20th Avenue South through traffic calming north of the site, even with the through movement diverter. Traffic circles have been found by many agencies to significantly reduce intersection collisions and slightly reduce midblock vehicle speeds. In order to be effective at reducing speeds and encourage yielding behavior, deflection of the driver's path upon entry to the traffic circle is required. At a three-legged intersection such as at South 332nd Street, additional pavement widening may be required to provide for adequate deflection and provide positive guidance to the driver. In no case should additional right-of-way be required. Pursuant to FWCP Policy TP5, the applicant will place the through movement diverter at the intersection at South 336th Street, and yield-controlled traffic circles at South 330th Street and South 332nd Street to reduce intersection collisions and midblock vehicle speeds.

59. Neighborhood Traffic Meetings were held June 3, 2004 and June 25, 2004 with the residents on 18th Avenue South to determine the best solution for improving 18th Avenue South. Based on the discussions at the meetings, t~~T~~he residential segment of 18th Avenue South will be improved to a ~~Type R~~modified street section, consisting of 24 foot wide street with vertical curb and gutter, 5-foot sidewalks and 2 additional street lights mounted on existing power poles. Traffic calming elements will be installed, including two speed humps, 1 crosswalk, bulb outs at the intersection of 18th Avenue S and S 341st Street and 18th Avenue S and S 344th Street to narrow the throat width of 18th Avenue S to 20 feet, and street signage to address no through truck traffic, children playing, speed humps, crosswalk and speed limit will be installed.~~The applicant has proposed that the existing bulb in the right-of-way where the existing cul-de-sac bulb is located be used as a location for a median island to create a chicane effect, and staff proposes that curb returns on 18th Avenue South be bulbed out into the intersections at South 341st Place and South 344th Street to reduce the potential for trucks to use 18th Avenue South through the residential neighborhood. Staff also recommends signage be placed to prohibit trucks on 18th Avenue South between South 341st Place and South 344th Street and two speed humps be installed. A Neighborhood Traffic Meeting was held June 3, 2004, and Staff will work with the residents on 18th Avenue South to determine the best solution for improving 18th Avenue South.~~

Christian Faith Center (Communication ID 473746)		
Comment ID	**Comment Text**	**Response**
1	CFC would prefer not to be any alternative for the OMF South Project. Any comments below are for the sole purpose of informing Sound Transit of the consequences and impacts to CFC from the two alternatives noted above and are not an express or implied consent to any selection of CFC as the preferred site for the OMF South Project.	Sound Transit appreciates the ongoing communication and coordination that has occurred with Christian Faith Center staff during project development. After considering the Draft EIS and the comments received, the South 336th Street Alternative was identified by the Sound Transit Board as the Preferred Alternative in December 2021 (Motion M2021-81). The Midway Landfill and South 344th Street alternatives continue to be evaluated in the Final EIS. The Board will select the project to be built following publication of the Final EIS.
2	The DEIS has not adequately understood and analyzed the CFC Campus, which has led to a flawed analysis of, in particular, the South 344th Street Alternative. More on this comment follows below. Ever since CFC's Campus has been identified as a potential site for the OMF South Project, CFC has essentially been "stuck" in place and time. CFC has halted the planning and implementation of additional projects. CFC cannot grow and expand its ministry. This is true for both the South 336th Street Alternative and the South 344th Street Alternative. CFC's selection as a site for the South OMF facility has created uncertainty and anxiety for tis members. Is their spiritual "home" going to be taken from them? Where will they go?	Sound Transit recognizes the difficulties that a project of this size and potential impact present for a religious center. Subsequent to the 2021 Draft EIS, FTA approved and the Sound Transit Board authorized (resolution number R2023-26) a hardship acquisition of the four parcels associated with the Christian Faith Center. The purpose of this type of acquisition is to alleviate a particular hardship to the owner when the property owner can document on the basis of health, safety, or financial reasons that remaining in the property poses an undue hardship compared to others. Hardship and protective acquisitions do not limit the evaluation of alternatives required under the NEPA process. No development on the parcels would occur until after FTA issues a ROD and if the Sound Transit Board selects to build the Preferred or South 344th Street alternatives. The hardship acquisition would allow Christian Faith Center to begin early coordination on potential future sites. Sound Transit's relocation staff are working closely with Christian Faith Center staff to inventory needs and provide relocation assistance so that the church and school receive the moving and reestablishment entitlements available. Sound Transit could also help with site selection and would continue to provide relocation advisory services.
3	If the South 336th Street Alternative becomes the final site, then CFC will be forced to lose its Campus as a whole under eminent domain or the treat of eminent domain and find a new campus location and start a new multi-year development process anew. This is no easy task.	Section 3.3, Acquisitions, Displacements, and Relocations, of the 2023 Draft EIS and this Final EIS includes a summary of Sound Transit's Acquisition and Relocation Policy.

Christian Faith Center (Communication ID 473746)		
Comment ID	**Comment Text**	**Response**
4	If the South 344th Street Alternative becomes the final site, CFC's situation becomes even worse. The DEIS simply and incorrectly assumes that the current site could be severed or bifurcated and somehow CFC could continue to operation on the remainder parcel. Because the Campus Approval is an integrated plan for the entire CFC Property, taking a significant portion for the South 344th Street Alternative disrupts the entire plan and creates a situation where CFC would be in violation of its approvals. Again, by way of example only and not to be exhaustive, taking the eastern portion of the CFC Campus for the South 344th Street Alternative Project means: • The remainder parcel no longer has a required storm water facility for its surface water management. • CFC's required access points no longer exist, because the DEIS assumes, incorrectly, that CFC uses only one access point. It is required to have multiple. • CFC's required recreational areas disappear.	Sound Transit acknowledges the challenges that would be faced by the Christian Faith Center if the South 344th Street Alternative is selected by the Sound Transit Board as the project to be built. If the South 344th Street Alternative were selected, Sound Transit would evaluate the site characteristics and Christian Faith Center's approval requirements as part of final design and appraisal process. Since identifying the South 336th Street Alternative as the Preferred Alternative, Sound Transit has moved forward with a hardship acquisition of the four parcels associated with the Christian Faith Center.
5	Beyond, the physical, land use, and environmental impacts are fiscal impacts. CFC has long term financing for its current Campus. Taking a significant portion of the property would impair the lender's collateral. Its loan would be called. With the remainder of the property now a non-conforming and non-compliant property, no lender would extend credit. The City of Federal Way could commence code enforcement action requiring CFC to come into compliance with storm water, access, and recreational facilities requirements, which CFC could not meet.	Please see the response to the previous comment (Comment ID 4).
6	CFC respectfully requests that Sound Transit carefully review the 107 page Campus Approval document to refine its analysis of impacts associated with the South 344th Street Alternative.	Sound Transit has reviewed and considered the requirements of the agreement between the Christian Faith Center and the city of Federal Way listed in the Concomitant Agreement and Development Agreement (July 10, 2004).

EQUIPPING THE NEXT GENERATION

33645 20TH AVE S. FEDERAL WAY, WA 98003
253.943.2500 MAIN OFFICE
PACIFICCHRISTIANACADEMY.COM

April 15, 2021

Dear Sound Transit Board:

We recognize that the Sound Transit Board is engaged in an important analysis of sites for a new maintenance facility. Pacific Christian Academy has been a tenant of Christian Faith church for the last 12 years as a separate entity, but prior to 2009 the school was part of the ministry for 23 years. We would like to express our hope that, when final decisions are made, there will be a home for the students who see PCA as their second family. We desire to keep the vision alive not only for our current students, but all the alumni, students, and families who have invested in the school over the last 35 years.

Pacific Christian Academy has been a contributing member of the Seattle/Federal Way community for decades. In that time, the school has demonstrated excellence in preparing young men and women to take their place as productive, contributing members of society. Strong moral values are the hallmark of a Pacific Christian education. Our value for service is lived out as our students volunteer at several critical organizations in our area. We believe we are a good community partner; our students enjoy volunteering in various outreach programs such as helping the elderly, cleaning parks, helping provide food for the hungry, serving in food banks, and partnering with other organizations who are making a positive change in the community.

The Federal Way Mirror noted, after looking at the EIS report, "Being the largest EE-12 Christian school in the Federal Way area, Pacific Christian has a very diverse K-12 student population." Our school provides an education to a widely diverse student population, thus serving the demographics of the families in Federal Way.

We understand the need for a maintenance facility for Sound Transit. We also believe there must be a place for PCA to continue its mission of equipping students to be socially relevant leaders. Time has been invested in looking for a new facility, should Christian Faith be the chosen site. That search has not produced an available site that would allow us to provide an educational experience equivalent to what our students are currently receiving. Our hope and request is that in 2023, Sound Transit will assist Pacific Christian Academy in finding a new home, should the Christian Faith site be chosen. Indeed, we are grateful for the willingness of Sound Transit staff to meet on more than one occasion with our Board of Trustees to discuss progress on the project. We feel confident that Sound Transit understands our desire to remain a viable educational option for the families of Federal Way.

Thank you for your time, effort, and your concern for Pacific Christian Academy. We look forward to hearing from you in the near future.

Sincerely,

Debbie Schindler
Head of School

RE: Comments on the Draft Environmental Impact Statement for the OMF South Facility

Dear Board Members:

THE SOUTH 344TH STREET ALTERNATIVE WOULD IMPACT THE MOST SOCIAL RESOURCES AND WOULD HAVE THE GREATEST NUMBER OF BUSINESS AND RESIDENTIAL DISPLACEMENTS AS COMPARED WITH THE OTHER BUILD ALTERNATIVES.
(Section 3.6.2.2, page 3.6-9 of the Draft Environmental Impact Statement) (DEIS)

Nowhere in the Executive Summary does the above conclusion appear. Yet it is totally accurate as shown in a comparison of the 344th Street site with either the Midway Land Fill Alternative or the South 336th Street Alternative for the following reasons:

A. Table 3.5-5 of the DEIS shows a total of 26 businesses affected at the 336th Street site as compared with 60 businesses at the 344th site. The 336th site will displace three businesses while the 344th Street site will displace 15. Estimated employee displacements are 94 for 336th and 248 for 344th.

B. Table 3.5-6 DEIS shows the total taxable value of properties that must be acquired at 336th equals 50.8 million, while the taxable value of properties that must be acquired at 344th is almost twice as much at 99.5 million. 336th requires acquisition of 36 parcels and 344th requires acquisition of 64 parcels. Furthermore, said Table does not reflect that the 25 acre, Christian Faith Center, located on the 336th site, is not on the tax roles.

C. Section 3.4.3.2 DEIS shows that the OMF facility at the 336th site would convert 25 acres of public institution property not currently on the tax roles and 27 acres of vacant land. Therefore, 52 of the 97 acres proposed for acquisition are either not on the tax roles or remain vacant. The DEIS does not fully consider this fact and how it compares with the 344th site.

D. The Executive Summary reflects that the environmental impacts to critical areas are approximately the same at the 336th and 344th sites. However, the Executive Summary does not reflect that selection of the 344th site will require conversion of the State Department of Transportation's Reserve Conservation Area that the State acquired under the Highway Beautification Act in 1965. While the DEIS recognizes that fact, it contains no discussion of the impacts of the conversion or the difficulty/cost in obtaining approval therefor.

E. The DEIS assumes that Sound Transit can find a suitable location for the Ellenos Yogurt business if it selects the 344th Alternative. The DEIS also assumes that, similar to an office/warehouse business, Ellenos can simply build-up its inventory prior to the move, and then use its inventory during the time necessary to move and acquire new equipment. Such is impossible. Yogurt has a very limited shelf life and Ellenos must constantly remain in operation to protect its product, its shelf space in retail outlets, and its position in an extremely competitive market. Thus, Ellenos cannot disassemble its equipment at its present location, move it to a new site, and secure proper permits. As forth in the Ellenos letter of March 26, 2021.

> "Equally important, it will take a minimum of a year to ensure that a new facility will efficiently and effectively produce product that meet product safety and quality parameters essential to remaining competitive and financially stable. **The myriad of steps require represent 2+ year process when an organization has the excess staffing to operate two facilities and assumes the project does not encounter unexpected setbacks, which pragmatically speaking, is not likely to be the case."**

Ellenos would need to abandon its equipment at its present location and purchase new equipment for its new location. Such is cost prohibitive.

F. Ellenos estimates relocation costs alone at above 25 million. Such cost does not account for ten of millions in business opportunity losses it will incur. Ellenos anticipates expanding to a 24/7 operation and hiring many new employees by the end of 2022. Selecting the 344th Street site will put an end to Ellenos yogurt.

Thank you for your consideration of the above matters.

Very truly yours,

Stephen K. Causseaux, Jr.
Managing Partner for Schindler Family Limited
Partnership, Owners of the Ellenos Building

Comment ID	**Comment Text**	**Response**
1	THE SOUTH 344TH STREET ALTERNATIVE WOULD IMPACT THE MOST SOCIAL RESOURCES AND WOULD HAVE THE GREATEST NUMBER OF BUSINESS AND RESIDENTIAL DISPLACEMENTS AS COMPARED WITH THE OTHER BUILD ALTERNATIVES. (Section 3.6.2.2, page 3.6-9 of the Draft Environmental Impact Statement) (DEIS) Nowhere in the Executive Summary does the above conclusion appear.	Table ES-1 in the Final EIS Executive Summary includes a comparison of key characteristics and impacts of all three build alternatives. Within the table, the Acquisitions subsection contains the total number of displaced businesses and residences, and the Environmental Justice, Social Resources, Community Facilities, and Neighborhoods subsection contains the number of displaced social and community resources. Additionally, Figure ES-9 and the associated Acquisitions, Land Use, and Economics text in Section ES.3, Comparison of Alternatives of the Executive Summary expands on these impacts.
2	A. Table 3.5-5 of the DEIS shows a total of 26 businesses affected at the 336th Street site as compared with 60 businesses at the 344th site. The 336th site will displace three businesses while the 344th Street site will displace 15. Estimated employee displacements are 94 for 336th and 248 for 344th.	The comment restates the information from the 2021 Draft EIS. Note that this table was updated in the 2023 Draft EIS and again in this Final EIS.
3	B. Table 3.5-6 DEIS shows the total taxable value of properties that must be acquired at 336th equals 50.8.million, while the taxable value of properties that must be acquired at 344th is almost twice as much at 99.5 million.336th requires acquisition of 36 parcels and 344th requires acquisition of 64 parcels. Furthermore, said Table does not reflect that the 25 acre, Christian Faith Center, located on the 336th site, is not on the tax roles. C. Section 3.4.3.2 DEIS shows that the OMF facility at the 336th site would convert 25 acres of public institution property not currently on the tax roles and 27 acres of vacant land. Therefore, 52 of the 97 acres proposed for acquisition are either not on the tax roles or remain vacant. The DEIS does not fully consider this fact and how it compares with the 344th site.	Section 3.5, Economics, in the 2023 Draft EIS and this Final EIS notes that the Christian Faith Center and the Pacific Christian Academy are not taxed. Section 3.5 includes a discussion of the difficulties involved with calculating specific property tax impacts. Overall, the impact is expected to be small given the reduction in taxable assessed valuation of acquired properties in relation to the area's overall tax base. As an example, the total taxable assessed valuation of real property for full and partial acquisitions for the South 344th Street Alternative accounts for 0.91 percent of Federal Way's overall assessed valuation in 2019; none of the alternatives exceed 1 percent.

Comment ID	**Comment Text**	**Response**
4	D. The Executive Summary reflects that the environmental impacts to critical areas are approximately the same at the 336th and 344th sites. However, the Executive Summary does not reflect that selection of the 344th site will require conversion of the State Department of Transportation's Reserve Conservation Area that the State acquired under the Highway Beautification Act in 1965. While the DEIS recognizes that fact, it contains no discussion of the impacts of the conversion or the difficulty/cost in obtaining approval therefor.	WSDOT Resource Conservation Areas are shown and discussed in Section 3.7, Visual and Aesthetic Resources, of the of the 2023 Draft EIS and this Final EIS. The mainline tail tracks associated with the South 344th Street Alternative would impact the two Resource Conservation Areas. During final project design, Sound Transit would incorporate specific measures to mitigate impacts to the Resource Conservation Areas, consistent with the WSDOT Roadside Policy Manual.
5	E. The DEIS assumes that Sound Transit can find a suitable location for the Ellenos Yogurt business if it selects the 344th Alternative. The DEIS also assumes that similar to an office/warehouse business, Ellenos can simply build-up its inventory prior to the move, and then use its inventory during the time necessary to move and acquire new equipment. Such is impossible. Yogurt has a very limited shelf life and Ellenos must constantly remain in operation to protect its product, its shelf space in retail outlets, and its position in an extremely competitive market. Thus, Ellenos cannot disassemble its equipment at its present location, move it to a new site, and secure proper permits.	In Section 3.3, Acquisitions, Displacements, and Relocations of the 2023 Draft EIS and this Final EIS, Sound Transit recognizes the difficulties of relocating an operation like Ellenos. Please see the response to Common Comment 1 in Table L.1-1, Responses to Common Comments, in the Final EIS.
6	F. Ellenos estimates relocation costs alone at above 25 million. Such cost does not account for ten of millions in business opportunity losses it will incur. Ellenos anticipates expanding to a 24/7 operation and hiring many new employees by the end of 2022. Selecting the 3441 Street site will put an end to Ellenos yogurt.	Please see the response to Common Comment 1 in Table L.1-1, Responses to Common Comments, in the Final EIS.

REAL GREEK YOGURT
ELLENOS
TRADITIONAL FAMILY RECIPE

March 26, 2021

Sound Transit Board
401 S. Jackson St.
Seattle, WA 98104

Dear Board Member,

We are writing to you regarding the Sound Transit Authority's (STA) draft Environmental Impact Statement for the Operations and Maintenance Facility South posted on March 5, 2021. Although we found the report to be fairly thorough, it failed to capture the $10's of millions in direct costs that would be incurred as a result of relocating the Ellenos manufacturing facility which is part of site 10A, also known as the South 344th Street site. In addition, the statement fails to account for the profound opportunity costs to be incurred by Ellenos and the impact on its future as a result if forced to relocate.

When asked by local media his reaction to the possibility of our site being selected, Ellenos Co-Founder and yogurt aficionado, Con Apostolopoulos' immediate reaction was that it would be catastrophic. As a lifelong yogurt manufacturer, Mr. Apostolopoulos knows all too well the sensitive nature of yogurt manufacturing. After an extensive assessment by the Ellenos Management Team his conclusion was reenforced. The economic and strategic ramifications, both immediate and long-term, to our company and its 130+ employees would be crippling and puts into question our ability to survive this dramatic disruption to the business. It will unravel years of strategic investment and development of which the Federal Way manufacturing facility has been central to and will continue to be well into the future.

Relocation of a yogurt manufacturing facility is an extremely complex and disruptive process. Any such effort would significantly undermine our ability to compete in this highly competitive category. This is further exacerbated by the fact such turmoil comes at an immensely critical juncture in our business as we are preparing for notable national distribution over the next 3-5 years. At the core of this challenge is the fact we produce a product with an extremely short shelf life. As such, we must be able to produce product a minimum of 5-days a week in order to meet demand and keep shelves stocked. Based on current growth trajectory we anticipate this will expand to a 24/7 operation by the end 2022. Any disruption to our supply chain will quickly erode the goodwill we have worked hard to foster through the years and result in an immediate retraction of our sales and associated momentum.

It is vitally important that the Sound Transit Authority understands that yogurt manufacturing does not permit the luxury of stockpiling inventory to accommodate the move from one location to another. Product must be consistently produced nearly every day of the week due to its limited shelf life. This becomes increasingly more critical as we achieve geographic expansion where time (due to transportation time to the east coast) becomes increasingly tight. Equally important, it will take a minimum of a year to ensure that a new facility will efficiently and effectively produce product that meet product safety and quality parameters essential to remaining competitive and financially stable. The myriad of steps required represent a 2+ year process when an organization has the excess staffing to operate two facilities and assumes the project does not encounter unexpected setbacks, which pragmatically speaking, is not likely to be the case. In addition, Ellenos is not presently staffed to address the extensive effort this presents, and we are not in a financial position to do so.

The enormity of relocation should be quite evident based on the overview provided above but does not capture the opportunity costs our organization will also incur as a result. In fact, the opportunity costs are virtually incalculable because they have to factor in not only past but future opportunities lost as a result of the tremendous setback this will create. Our entire 10-year plan is built around having a well-established and operating manufacturing facility so that our focus could be on executing sales, marketing and innovation plans vital to a successful national expansion. We are still in the throes of seeking to reach that critical milestone. Relocating our manufacturing facility will place us a minimum of 3-years behind schedule and result in untold additional costs as we seek to regain our position in the uber-premium yogurt space.

In addition to opportunity costs there is the work around planning, construction, and implementation of a new manufacturing facility. To be very clear, in order to survive we will need to have a fully functioning manufacturing facility before we commence shutting down the current location. We have invested millions of dollars in equipment in order to meet current and future demand. The equipment will need to be replaced in full in order to have a fully functioning facility before we shut down the current location. This includes meeting strict Federal, State and Local permitting requirements. The net result is tens of millions of dollars will be required to duplicate our current operation. There will be very little recovered in terms of selling of the current facility's equipment and no recovery of the significant investment in the infrastructure that was required to design our plant to produce our world class product.

In conclusion, the Environmental Impact Statement, although comprehensive, fails to capture the full impact that selection of site 10A would have on Ellenos. The costs of relocation alone are estimated to be well above $25MM and does not account for the $10's of millions in opportunity costs we will incur. These additional facts combined with the EIS for OMF South clearly indicates site 10a is a poor choice relative to the other options put forth. It is hard to fathom how the Sound Transit Authority could choose site 10A given its impact on a PacNW icon (Ellenos), especially considering the additional costs not captured in the EI Statement. This compounded by the fact that not only will Ellenos suffer the grave consequences of such a choice, but so too will the nearly 100 property owners, businesses, family dwellings and churches located within the boundaries of site 10A. We therefore request the STA choose an alternative to the 344th street location when making your final decision.

Respectfully submitted,

Con Apostolopoulos / Co-Founder

Bob Klein / Co-Founder

1	We are writing to you regarding the Sound Transit Authority's (STA) draft Environmental Impact Statement for the Operations and Maintenance Facility South posted on March 5, 2021. Although we found the report to be fairly thorough, it failed to capture the $10's of millions in direct costs that would be incurred as a result of relocating the Ellenos manufacturing facility which is part of site 10A, also known as the South 344th Street site. In addition, the statement fails to account for the profound opportunity costs to be incurred by Ellenos and the impact on its future as a result if forced to relocate.	Relocation estimates are included in the opinion of probable cost provided in Table 2.5-1 in the Final EIS. Due to the level of information available in this early phase of project development and the variety of factors that influence it, opportunity cost is not evaluated in the EIS. SEPA and NEPA do not require an analysis of economic opportunity costs of land use decisions but rather an evaluation of environmental and economic impacts on existing and reasonably foreseeable land uses for each build alternative.
2	Relocation of a yogurt manufacturing facility is an extremely complex and disruptive process. Any such effort would significantly undermine our ability to compete in this highly competitive category. This is further exacerbated by the fact such turmoil comes at an immensely critical juncture in our business as we are preparing for notable national distribution over the next 3-5 years. At the core of this challenge is the fact we produce a product with an extremely short shelf life. As such, we must be able to produce product a minimum of 5-days a week in order to meet demand and keep shelves stocked. Based on current growth trajectory we anticipate this will expand to a 24/7 operation by the end 2022. Any disruption to our supply chain will quickly erode the goodwill we have worked hard to foster through the years and result in an immediate retraction of our sales and associated momentum. It is vitally important that the Sound Transit Authority understands that yogurt manufacturing does not permit the luxury of stockpiling inventory to accommodate the move from one location to another. Product must be consistently produced nearly every day of the week due to its limited shelf life. This becomes increasingly more critical as we achieve geographic expansion where time (due to transportation time to the east coast) becomes increasingly tight. Equally important, it will take a minimum of a year to ensure that a new facility will efficiently and effectively produce product that meet product safety and quality parameters essential to remaining competitive and financially stable. The myriad of steps required represent a 2+ year process when an organization has the excess staffing to operate two facilities and assumes the project does not encounter unexpected setbacks, which pragmatically speaking, is not likely to be the case. In addition, Ellenos is not presently staffed to address the extensive effort this presents, and we are not in a financial position to do so.	Please see Section 3.3, Acquisitions, Displacements, and Relocations, and Section 3.5, Economics in the 2023 Draft EIS and this Final EIS. These sections acknowledge the unique circumstances of Ellenos Yogurt, and the relocation challenges the business would face, if the South 344th Street Alternative were selected as the project to be built.

3	The enormity of relocation should be quite evident based on the overview provided above but does not capture the opportunity costs our organization will also incur as a result. In fact, the opportunity costs are virtually incalculable because they have to factor in not only past but future opportunities lost as a result of the tremendous setback this will create. Our entire 10-year plan is built around having a well-established and operating manufacturing facility so that our focus could be on executing sales, marketing and innovation plans vital to a successful national expansion. We are still in the throes of seeking to reach that critical milestone. Relocating our manufacturing facility will place us a minimum of 3-years behind schedule and result in untold additional costs as we seek to regain our position in the uber-premium yogurt space. In addition to opportunity costs there is the work around planning, construction, and implementation of a new manufacturing facility. To be very clear, in order to survive we will need to have a fully functioning manufacturing facility before we commence shutting down the current location. We have invested millions of dollars in equipment in order to meet current and future demand. The equipment will need to be replaced in full in order to have a fully functioning facility before we shut down the current location. This includes meeting strict Federal, State and Local permitting requirements. The net result is tens of millions of dollars will be required to duplicate our current operation. There will be very little recovered in terms of selling of the current facility's equipment and no recovery of the significant investment in the infrastructure that was required to design our plant to produce our world class product. In conclusion, the Environmental Impact Statement, although comprehensive, fails to capture the full impact that selection of site 10A would have on Ellenos. The costs of relocation alone are estimated to be well above $25MM and does not account for the $10's of millions in opportunity costs we will incur.	Please see the responses to comments 1 and 2 of this letter.
4	These additional facts combined with the EIS for OMF South clearly indicates site 10a is a poor choice relative to the other options put forth. It is hard to fathom how the Sound Transit Authority could choose site 10A given its impact on a PacNW icon (Ellenos), especially considering the additional costs not captured in the EI Statement. This compounded by the fact that not only will Ellenos suffer the grave consequences of such a choice, but so too will the nearly 100 property owners, businesses, family dwellings and churches located within the boundaries of site 10A. We therefore request the STA choose an alternative to the 344th street location when making your final decision.	After considering the Draft EIS and the comments received, the South 336th Street Alternative, was identified by the Sound Transit Board as the Preferred Alternative in December 2021 (Motion M2021-81). The Board will select the project to be built following the Final EIS.

Subject: Public comments OMF South

Public comments for Sound Transit, OMF South

1. The Draft EIS does not classify Garage Town Owners as commercial owners or residential owners and these individuals are not included in the count of property owners or parcels, even though occupants of a 4 plex were counted, as documented in Table ES-1 in the Draft EIS. This inaccurate count distorts the true number of individuals impacted in the data for the South 344th Street site contained in the Executive Summary. How do these inaccuracies get corrected and shared with Sound Transit Board members? See Table ES-1 on page ES-17 of the Executive Summary. The table only shows 20 Residential and 11 Business Displacements for the South 344th Street Site. Garage Town has 67 separate individual Condominium parcels and owners. Also see Table 3.5-5 in the Draft EIS.
2. The South 336th Street and The South 344th Street sites require Mainline track for the TDLE to be constructed. What happens if through the Budget review process, Sound Transit decides not to construct the TDLE? The cost of the two southern options for the OMF becomes much more expensive, which might make the Landfill site a better choice. This issue was not discussed in the Draft EIS. See Figure E2.3-2 in the Draft EIS.
3. Is Sound Transit in conversation with the Federal Government or the State of Washington to see if grant money can be made available to help Sound Transit fund the development of the Landfill Site?

Other Comments:

The sizes, in acres, of the three sites is different in Draft EIS Table 3.4-2 and EIS Executive Summary. The South 344th Street site is listed as 59.3 acres in the table and 65 acres in the Executive Summary. Depending on the size one uses for comparison purposes, the South 344th Street site may be too small.

The Draft EIS did not mention that the Christian Faith Center may want to sell to Sound Transit. How do Board Members become aware of this possibility?

No mention of Federal Grants from the EPA or other government agencies to assist with redevelopment costs associated with the landfill. Does the State of Washington support the Landfill Site

1	The Draft EIS does not classify Garage Town Owners as commercial owners or residential owners and these individuals are not included in the count of property owners or parcels, even though occupants of a 4 plex were counted, as documented in Table ES-1 in the Draft EIS. This inaccurate count distorts the true number of individuals impacted in the data for the South 344th Street site contained in the Executive Summary. How do these inaccuracies get corrected and shared with Sound Transit Board members? See Table ES-1 on page ES-17 of the Executive Summary. The table only shows 20 Residential and 11 Business Displacements for the South 344th Street Site. Garage Town has 67 separate individual Condominium parcels and owners. Also see Table 3.5-5 in the Draft EIS.	Please see the response to Common Comment 1 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	The South 336th Street and The South 344th Street sites require Mainline track for the TDLE to be constructed. What happens if through the Budget review process, Sound Transit decides not to construct the TDLE? The cost of the two southern options for the OMF becomes much more expensive, which might make the Landfill site a better choice. This issue was not discussed in the Draft EIS. See Figure E2.3-2 in the Draft EIS.	The purpose of this EIS is to evaluate the potential environmental impacts of OMF South, including the mainline tracks that would connect the South 336th Street and South 344th Street alternatives, regardless of whether TDLE is constructed. The cost of the mainline tracks is included in the cost estimates for the Preferred and South 344th Street alternatives as shown in Table ES-1 in the Executive Summary and in Table 2.5-1 in Section 2.5, Funding and Opinion of Probable Costs, of the Final EIS.
3	Is Sound Transit in conversation with the Federal Government or the State of Washington to see if grant money can be made available to help Sound Transit fund the development of the Landfill Site?	Please see the response to Common Comment 5 in Table L.1-1, Responses to Common Comments, in the Final EIS.
4	The sizes, in acres, of the three sites is different in Draft EIS Table 3.4-2 and EIS Executive Summary. The South 344th Street site is listed as 59.3 acres in the table and 65 acres in the Executive Summary. Depending on the size one uses for comparison purposes, the South 344th Street site may be too small.	The Executive Summary description provides the permanent acreage of land needed to operate the OMF South. Table 3.4-2 of the 2023 Draft EIS and this Final EIS reports the amount of land that would be converted for a transportation use for each of the alternatives. If land within an alternative is already considered to be a transportation use (for example, an existing roadway), it is not considered a land use conversion.

Comment ID	**Comment Text**	**Response**
5	The Draft EIS did not mention that the Christian Faith Center may want to sell to Sound Transit. How do Board Members become aware of this possibility?	Prior to publication of the Draft EIS, Sound Transit notified owners of potentially affected parcels of the project and potential effects. This included coordination with representatives of the Christian Faith Center. Sound Transit will continue to coordinate with property owners throughout the course of the project. Subsequent to the 2021 Draft EIS, FTA approved, and the Sound Transit Board authorized (Resolution Number R2023-26) a hardship acquisition of the four parcels associated with the Christian Faith Center. The purpose of a hardship acquisition is to alleviate a particular hardship to the owner when the property owner can document on the basis of health, safety, or financial reasons that remaining in the property poses an undue hardship compared to others. Hardship acquisitions do not limit the evaluation of alternatives required under the NEPA process. No development on the parcels would occur until after FTA issues a ROD and if the Sound Transit Board selects to build the Preferred or South 344th Street alternatives.
6	No mention of Federal Grants from the EPA or other government agencies to assist with redevelopment costs associated with the landfill. Does the State of Washington support the Landfill Site	The State of Washington has not expressed a preference on the site alternatives for OMF South. Please see the response to Common Comment 5 in Table L.1-1, Responses to Common Comments, in the Final EIS.

Hello, My name is Rod Snyder an I am the VP of Sales and Branch Operations for Red Canoe Credit Union. I am leaving the following comments as to express our hopes and concerns about how the proposed OMF South project site selection might impact our business operations. We have a credit union branch located at 33616 Pacific HWY S in Federal Way. This branch has vehicle access from Pac HWY northbound and from both directions on 336th. The South 336th Street location brings up most of my concerns, especially during the construction phase. The Draft EIS indicated there could be as many as 75 truck trips per day. With this volume of truck traffic on 336th and Pac HWY our members might find it difficult to access their branch and conduct their banking. I am also concerned about road and sidewalk construction on 336th that would temporarily close our vehicle access from our 336th entrance. Here is my question and request for this project, if 336th is selected. Will construction truck traffic travel to the job site using the east side of 336th/Weyerhaeuser Way to access the freeway? This makes much more sense since this area is nearly void of any homes or businesses that would be impacted by the high volume of truck traffic. Having trucks travel up and down HWY 99 to access 336th is a huge congestion problem for an all ready busy intersection. If 336th is selected, my business and so many more would request that the project expect truck traffic to use the east entrance of 336th East and Weyerhaeuser Way to access the job site. Also, if there will be road closure on 336th I request that there never be both directions closed at any given time. My business only has 2 access points, northbound Pac HWY and 336th. If you close 336th you will eliminate a primary access point for my members to conduct business. After reviewing the Draft EIS and the potential negative effects for each site alternative, I support the Midway Landfill as the best location. Although cost is the highest, it will have the least impact on community and businesses as well as repurposing an otherwise dead piece of property in our community. Please consider my request as this project progresses. I would like a response. Thank you.
Rod Snyder

If you close 336th you will eliminate a primary access point for my members to conduct business.	The 2023 Draft EIS and this Final EIS include a description of the assumed truck routes in Section 3.2, Transportation. As described in Section 3.2.2.4, Avoidance and Minimization of Impacts, Sound Transit would prepare a construction transportation management plan addressing hauling routes and impacts to local businesses, among other topics. If driveway closures are required, access to these properties would be maintained to the extent practical. If access to a business could not be maintained during construction, the specific construction activity would be reviewed to determine whether it could occur during non-business hours or whether the parking and users of this access could be accommodated at an alternative location.
2	After reviewing the Draft EIS and the potential negative effects for each site alternative, I support the Midway Landfill as the best location. Although cost is the highest, it will have the least impact on community and businesses as well as repurposing an otherwise dead piece of property in our community.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.

Hello there- I run Federal Way Custom Jewelers- the oldest retailer in Federal Way. I have seen the changes and impacts of transit and am excited for light rail. That said, I have been very disappointed by some of the decisions, or lackthereof, by Sound Transit when it comes to OMF South. The obvious best choice for OMF South is the Midway Landfill site. This is unused space, that no one but the taxpayer could afford to make usable. Furthermore, the other options would have major impacts on local businesses and organizations and negatively impact our local economy. If the megachurch leaves, I lose clients on weekends. If Ellenos and the other businesses in the corporate park are forced to relocate, then those employees and high paying jobs go with them, and those are my clients too. Sound Transit is worried about cost- the Federal government is funding most of this project. I am sure there is more grant money available to clean up the environmental issues at midway. The south sound has repeatedly been taken advantage of- we have the most low wage workers, people of color, and commuters who could use the transit, yet we are getting light rail last, AFTER the north end and east side. So, do the right thing for the south sound this time, and make up for past transgressions. It will help get my future votes and support in favor of Sound Transit. I implore Sound Transit: spend the extra money, use the wasted space, clean up our local environment, and place the OMF south on the midway landfill.

Brandon Moak, Federal Way Custom Jewelers (Communication ID 474310)

1	The obvious best choice for OMF South is the Midway Landfill site. This is unused space, that no one but the taxpayer could afford to make usable.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	Furthermore, the other options would have major impacts on local businesses and organizations and negatively impact our local economy. If the megachurch leaves, I lose clients on weekends. If Ellenos and the other businesses in the corporate park are forced to relocate, then those employees and high paying jobs go with them, and those are my clients too.	Sound Transit provides relocation assistance for displaced businesses, as described in Section 3.3, Acquisitions, Displacements, and Relocations of the 2023 Draft EIS and this Final EIS. Displaced businesses may choose to relocate in the area or outside of the area. The OMF itself will be a source of employment, providing approximately 610 jobs.
3	Sound Transit is worried about cost- the Federal government is funding most of this project. I am sure there is more grant money available to clean up the environmental issues at midway.	Please see the response to Common Comment 5 in Table L.1-1, Responses to Common Comments, in the Final EIS.

My business and livelihood is on the line . Northwest Equipment Sales and Rentals is positioned on the I5 corridor and Hwy 18. We employ approx 10 people . The location we purchased in 2003 was strategically situated for logistics since we haul heavy rental equipment up and down the I5 corridor. There is currently no property available that is zoned M2 or M3. This will have a devastating affect on our Business located at 2011 So 341st place in Federal Way . Please choose an alternate site like Christian Faith Center or the Midway landfill

Russ Hibbard, Northwest Equipment Sales, and Rentals (Communication ID 474314)

There is currently no property available that is zoned M2 or M3. This will have a devastating affect on our Business located at 2011 So 341st place in Federal Way. Please choose an alternate site like Christian Faith Center or the Midway landfill	Section 3.3, Acquisitions, Displacements, and Relocations, in the 2023 Draft EIS and this Final EIS, notes the difficulties of relocating certain properties. As described in Section 3.3, Sound Transit provides compensation and support for business relocations. Section 3.5, Economics, notes that businesses that use machinery or hazardous substances may require large parcels or have additional challenges that may make relocation difficult.

Subject: Scott Halverson/[redacted]

Dear Sound Transit,

Thank you for taking time to speak with myself and my consultant, David Peterson, about the potential use acquisition/condemnation of my property located at [redacted] Kent Wa 98032. I am the owner of this property (Race King LLC) and i currently run 2 businesses out of this location: My septic is my primary use of the property where i park my trucks and run my business as well as my racing business which is more of a hobby.

This property is slated to be part of the Midway Landfill alternative for the Operations and Maintenance Facility for the Light Rail System. My property has already been impacted in the past due to street widening and improvements along Pacific Highway. If my property were to be impacted any further by partial condemnation or easement, then it would essentially be unusable for my businesses, and market value of the property would be severely negatively impacted by any future owner. Having said that, I would be open to selling my property to Sound Transit as long as i could find a replacement property that would fit my business needs.

If Sound Transit does pick the Midway Alternative, then i look forward to further discussions about my property that would be a win-win for both parties.

Sincerely,
Scott Halverson

1	This property is slated to be part of the Midway Landfill alternative for the Operations and Maintenance Facility for the Light Rail System. My property has already been impacted in the past due to street widening and improvements along Pacific Highway. If my property were to be impacted any further by partial condemnation or easement, then it would essentially be unusable for my businesses, and market value of the property would be severely negatively impacted by any future owner. Having said that, I would be open to selling my property to Sound Transit as long as i could find a replacement property that would fit my business needs.	Sound Transit would begin the property acquisition process after the Final EIS is published, and the Sound Transit Board selects the project to be built. Sound Transit would work with affected property owners to determine relocation needs. Section 3.3, Acquisitions, Displacements, and Relocations includes a summary of Sound Transit's acquisition and relocation policy. A fair and reasonable analysis of your property's value would be addressed in an appraisal and a review appraisal before the agency makes a determination of just compensation. If a partial acquisition or permanent easement were to render a remainder portion of the property unusable or the business untenable, all efforts would be made to fairly compensate for the real estate and provide entitlements for relocation.

GREATER
FEDERAL WAY
Chamber of Commerce

DT: April 19, 2021

TO: Sound Transit Board

FR: Greater Federal Way Chamber of Commerce

Public Comment: Operations and Maintenance Facility South

The Greater Federal Way Chamber of Commerce continues to identify transportation infrastructure as a priority, recognizing the necessary investment of mass transit/light rail to meet the growing demands of a growing business community in the South Puget Sound region.

As an economic development focused organization, the Chamber recognizes Sound Transit's investment in the Federal Way area with the current construction of light rail stations at 320th Street and Highline College. As the strategic plan for light rail reaches further to the south, the proposed Operations and Maintenance Facility (OMF) South, becomes a critical component for expansion of the system.

The business leaders at that Chamber have reviewed the 24 proposed OMF South sites and ask the Sound Transit Board to note the guiding principles important to the Chamber of Commerce in their evaluation of the final three sites, as follows:

- Creation of permanent, sustainable living wage jobs;
- Minimum business displacement for existing jobs;
- Enhanced opportunities for transit-adjacent development;
- Impact of economic multipliers in the community;
- Environmental issues, including health concerns and the stewardship of resources such as wetlands and trails;
- Cost of strategic growth for transportation infrastructure.

The Chamber remains focused on the diversification of the economic base of Federal Way, including the maximum retention of commercial enterprises which provide the City with its tax base and within a range of industries from light manufacturing to minority-owned businesses.

In sum, the Greater Federal Way Chamber of Commerce encourages Sound Transit to determine the OMF South site based on what is most favorable to new and existing economic opportunities in our area.

Submitted on behalf of the business community at the Federal Way Chamber,

Rebecca Martin, CCE
President and CEO

Federal Way Chamber of Commerce (Communication ID 479627)

1	The business leaders at that Chamber have reviewed the 24 proposed OMF South sites and ask the Sound Transit Board to note the guiding principles important to the Chamber of Commerce in their evaluation of the final three sites, as follows: • Creation of permanent, sustainable living wage jobs; • Minimum business displacement for existing jobs; • Enhanced opportunities for transit-adjacent development; • Impact of economic multipliers in the community; • Environmental issues, including health concerns and the stewardship of resources such as wetlands and trails; • Cost of strategic growth for transportation infrastructure. The Chamber remains focused on the diversification of the economic base of Federal Way, including the maximum retention of commercial enterprises which provide the City with its tax base and within a range of industries from light manufacturing to minority-owned businesses. In sum, the Greater Federal Way Chamber of Commerce encourages Sound Transit to determine the OMF South site based on what is most favorable to new and existing economic opportunities in our area.	The Sound Transit Board identified the South 336th Street Alternative as the Preferred Alternative, as described in Section 2.2.6 of the 2023 Draft EIS and this Final EIS. Prior to identification of the Preferred Alternative, the Sound Transit Board considered the 2021 Draft EIS analysis and comments on the 2021 Draft EIS, among other factors. The Board will consider the Draft EIS comments, Final EIS analysis, and other factors prior to selection of the project to be built.

WE IMPLORE YOU TO

PROTECT FEDERAL WAY

April 18, 2021

pac@protectfederalway.org
Protect Federal Way

Dear Sound Transit Board & EIS Team:

Thank you for your diligent work to study the three OMF South locations in greater detail in this Draft EIS. We the citizens of Federal Way, Kent, Auburn, and nearby south Sound communities appreciate the focus being placed on the impact from OMF South site decisions on our neighborhoods and people.

As we have seen in your Draft EIS, choosing the **South 344th Street** site would negatively impact the community in the following ways:

- The largest negative economic impacts on citizens and government
- The largest negative street and zoning impacts
- The largest negative wetland and stream impacts
- The largest negative property and relocation costs for Sound Transit
- The **greatest number of residential evictions at 79**
- The **greatest number of business evictions**, at 12 (and **we believe this is incorrectly low**, as that does not include small businesses in rented spaces and in unmarked spaces such as GarageTown. We consider this **25+ business evictions**).
- Three local churches (and we believe the **impact of relocating the FCC-licensed broadcast tower** for Trinity Broadcasting KTBW-TV **has not been considered** in the Draft EIS)
- The **greatest number of jobs lost at 248**.

In addition to these serious impacts to homes, jobs, and lives in our community, we also think the **Draft EIS does not address these additional concerns** about the South 344th Street site:

- The **increased relocation costs** for business owners and tenants of industrial buildings in the South 344th Street site. Dismantling and transporting industrial equipment such as the Ellenos Yogurt plant, vehicle lifts in auto shops and at

Garage Town, the KTBW-TV broadcast tower, and numerous others represent significant additional relocation costs that, while not part of the Draft EIS scope, should be considered as incremental additional costs of selecting this site.

- **Comparable properties for relocation** of businesses have not been priced. There are not viable properties in the Federal Way community or indeed anywhere within 20+ miles of the South 344th Street site to relocate many of these businesses. As this is the last industrial zone in Federal Way, choosing this site **immediately evicts all industrial businesses from Federal Way, permanently**. Obtaining license to relocation the KTBW-TV broadcast tower will be much more complex and costly than simply finding a new plot of land. Obtaining properties comparable to the GarageTown complex will be significantly more expensive (we estimate 2x-3x) than the current tax value of those properties. The true cost of choosing the South 344th Street site will be borne later, by the Sound Transit relocation committee, but **it is misleading not to include an estimate of that cost** when evaluating and selecting a site.
- The **true business costs of relocation**. Many small businesses asked by Sound Transit to relocate will simply fold and the jobs they represent will evaporate as the toll of relocation will overburden them. For example, the Ellenos Yogurt operation would need to build a duplicate facility in another location and shift all their manufacturing capacity before the existing facility could be dismantled, meaning the several multi-million-dollar investments made in their current property would need to be repeated. Businesses like Ellenos would be **faced with huge capital expenses not covered by Sound Transit that have no long-term gain to their business**. Every business targeted by relocation would be forced to make the same difficult decisions, and many will fold under the extreme burden.

Sound Transit has provided many opportunities for citizens to speak on this issue and share concerns and views with the Sound Transit Board and the Sound Transit teams. As citizens, we have shared with Sound Transit our view that choosing the South 344th Street site represents too great a cost to Federal Way to be considered viable.

- **465 citizens have signed paper and online petitions** that have been submitted to Sound Transit
- More than 45 individual citizens have sent specific comments into the Draft EIS process.

- Citizens have attended Sound Transit presentations and Sound Transit Board meetings to share these concerns.
- Citizens have also attended Federal Way City Council meetings to share concerns with Federal Way council members and ask for help.

For yourselves on the Sound Transit Board and Sound Transit planning teams, if there was any doubt which of the three remaining OMF South sites had the highest costs for citizens, businesses, and the community, these voices should have made it quite clear: **the South 344th Street Site is the most painful and costly choice for everyone**. On behalf of all of us, please preserve homes, jobs, businesses, and the future of Federal Way by removing this site from further consideration.

Thank you for your empathetic and logical decision.

Brian Nash

Chair, Protect Federal Way

1	As we have seen in your Draft EIS, choosing the South 344th Street site would negatively impact the community in the following ways: • The greatest number of residential evictions at 79. • The greatest number of business evictions, at 12 (and we believe this is incorrectly low, as that does not include small businesses in rented spaces and in unmarked spaces such as GarageTown. We consider this 25+ business evictions). • Three local churches (and we believe the impact of relocating the FCC-licensed broadcast tower for Trinity Broadcasting KTBW-TV has not been considered in the Draft EIS)	Please see the response to Common Comments 1 and 2 in Table L.1-1, Responses to Common Comments, in the Final EIS. Section 3.3, Acquisitions, Displacements, and Relocations, of the 2023 Draft EIS was updated to include the displacement of the Trinity Broadcasting tower as a potential impact associated with the South 344th Street Alternative. The Trinity Broadcasting Network offices are permanently closed; if tower relocation is necessary, Sound Transit would work with the owner, as outlined in Section 3.3. This update is reflected in this Final EIS.
2	In addition to these serious impacts to homes, jobs, and lives in our community, we also think the Draft EIS does not address these additional concerns about the South 344th Street site: • The increased relocation costs for business owners and tenants of industrial buildings in the South 344th Street site. Dismantling and transporting industrial equipment such as the Ellenos Yogurt plan, vehicle lifts in auto shops and at Garage Town, the KTBW-TV broadcast tower, and numerous others represent significant additional relocation costs that, while not part of the Draft EIS scope, should be considered as incremental additional costs of selecting this site.	Acquisition and relocation costs were included in the conceptual capital cost estimates listed in Table 2.6-1 of the 2021 Draft EIS. These estimates were updated in the 2023 Draft EIS and are now found in Table 2.5-1, Opinion of Probable Cost for Preliminary Engineering Design of the Build Alternatives, in this Final EIS.

Protect Federal Way Brian Nash (Communication ID 473676)

3	• Comparable properties for relocation of businesses have not been priced. There are not viable properties in the Federal Way community or indeed anywhere within 20+ miles of the South 344th Street site to relocate many of these businesses. As this is the last industrial zone in Federal Way, choosing this site immediately evicts all industrial businesses from Federal Way, permanently. Obtaining license to relocation the KTBW-TV broadcast tower will be much more complex and costly than simply finding a new plot of land. Obtaining properties comparable to the GarageTown complex with be significantly more expensive (we estimate 2x-3x) than the current tax value of those properties. The true cost of choosing the South 344th Street site will be borne later, by the Sound Transit relocation committee, but it is misleading not to include an estimate of that cost when evaluating and selecting a site.	Acquisition and relocation costs are included in the conceptual capital cost estimates in Table 2.5-1, Opinion of Probable Cost for Preliminary Engineering Design of the Build Alternatives, in this Final EIS. Section 3.3, Acquisitions, Displacements, and Relocations, describes the opportunities and potential challenges associated with relocating certain businesses.
4	• The true business costs of relocation. Many small businesses asked by Sound Transit to relocate will simply fold and the jobs they represent will evaporate as the toll of relocation will overburden them. For example, the Ellenos Yogurt operation would need to build a duplicate facility in another location and shift all their manufacturing capacity before the existing facility could be dismantled, meaning the several multi-million-dollar investments made in their current property would need to be repeated. Businesses like Ellenos would be faced with huge capital expenses not covered by Sound Transit that have no long-term gain to their business. Every business targeted by relocation would be forced to make the same difficult decisions, and many will fold under the extreme burden.	Sound Transit acknowledges the difficulties and expenses involved with business relocations. Section 3.5, Economics, of the 2023 Draft EIS and this Final EIS describes some of the difficulties associated with relocation. As described in Section 3.3, Acquisitions, Displacements, and Relocations, Sound Transit would provide relocation assistance and would compensate affected property owners according to the provisions specified in Sound Transit's Real Property Acquisitions and Relocation Policy, Procedures, and Guidelines; the federal Uniform Relocation Assistance and Real Property Acquisition Policies Act; and the State of Washington's relocation and property acquisition laws and regulations.
5	For yourselves on the Sound Transit Board and Sound Transit planning teams, if there was any doubt which of the three remaining OMF South sites had the highest costs for citizens, businesses, and the community, these voices should have made it quite clear: the South 344th Street site is the most painful and costly choice for everyone. On behalf of all of us, please preserve homes, jobs, businesses and the future of Federal Way by removing this site from further consideration.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.

Public comments to Sound Transit Draft Against the Garage Town site

Jerry Carr [redacted]

Tue 4/13/2021 7:05 AM

To:Email The Board <EmailTheBoard@soundtransit.org>;OMFSouthDEIS <OMFSouthDEIS@soundtransit.org>

CAUTION: This email originated from a contact outside Sound Transit. Remember, do not click any links or open any attachments unless you recognize the sender and know the content is safe. Report any suspicious email by clicking the “fish” button in Outlook. Thank you! ST Information Security

I would like to add my voice to the public comments against the Garage Town site for the following reasons.

- The Draft EIS did not specifically include GT owners as residential or business. All 58 Garage Town owners should be included as property owners. All GT owners will be displaced if the S 344th site is selected.
- Ask how evaluation criteria is weighted. If all criteria are weighted equally, then Midway landfill should be the preferred site.
- The South 344th Site generates the most Economic activity, real estate tax and other taxes, compared to the other two sites. The landfill Site and The Christian Faith Center are not on the tax rolls.
- Table 3.3-2 in the DEIS, should be changed to include an accurate parcel count, all GT condo parcels should be included. The S 336th Street site has 19 tax parcels; The S 344th Street site has 109 tax parcels.
- If the South 344th Street is chosen 248 people will lose their jobs, 94 jobs will be lost if the 336th Street site is chosen.
- The Draft EIS did not mention that The Christian Faith Center may want to sell the property. Sound Transit needs to be in conversation with The Christian Faith Center to confirm their desire to sell the property.
- The S 344th Street site is close to the South Federal Way Station and therefore should be considered for Transit oriented development and not considered for the OMF South.
- No mention of possible EPA or other Federal or State Grants to lower cost of the Landfill site.
- Many of the sections of the Draft EIS included numbers and language that included information about the Main Line Extension which made it difficult to look at differences between the S 336th Street site and the S 344th Street sites.
- The Draft EIS did not clearly say that there will be significantly fewer truck trips and less site work on the S 336th Street site. The site work on the S 336th Street site has the lowest impact of all three sites.
- The Full Excavation option for the Midway Landfill site, is not much more costly than the other sites and has fewer negative impacts. This site is favored by most Cities and individuals, and should be selected as the preferred OMF Site.
- GT cannot be rebuilt in King County at a reasonable cost received from Sound Transit. and there is no existing property in King County like GT. Community would be destroyed.
- It would be extremely difficult and cost prohibitive to relocate the Ellenos Yogurt facility and maintain delivery to customers. If the South 344th Street site is chosen Ellenos Yogurt would go out of business.

- The Executive Summary of the DEIS reflects that the environmental impacts of the 336th Site and the S 344th sites are about the same. It does not reflect that the selection of the 344th Site would require the conversion of the Washington DOT Reserve Conservation Area and retention pond adjacent to I-5 being relocated to an additional parcel to the south of 344th street, which is not included in many of the site maps for The 344th site.
- If The Sound Transit Board decides not construct Tacoma Dome Link Extension, selection of the S 336th and S 344th sites would require excess mainline track to be constructed.
- The Draft EIS states, on page 3.6-9: " The South 344th Street alternative would impact the most social resources and would have the greatest number of business and residential displacements as compared with the other build alternatives." This statement of fact was not in the DEIS Executive Summary, and it should be included.
- There are 3 churches located within the S 344th Street site. Is it better to disrupt three churches or 1 church?
- Existing street improvements to the S 344th Street site, not adequate to serve the OMF. Significant improvements to S 344th and S 342nd streets would have to be made. This issue was not addressed in the DEIS

--

Regards, Jerry A. Carr

Public Communication: Public Comments to Sound Transit Against the Garage Town Site, Submitted by 5 Commenters		
Comment ID	**Comment Text**	**Response**
1	The Draft EIS did not specifically include GT owners as residential or business. All 58 Garage Town owners should be included as property owners. All GT owners will be displaced if the S 344th site is selected.	Please see the response to Common Comment 1 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	Ask how evaluation criteria is weighted. If all criteria are weighted equally, then Midway landfill should be the preferred site.	The purpose of the EIS is to identify potential significant adverse environmental impacts of each proposed alternative. The EIS evaluation is not weighted. Please see the response to Common Comment 1 in Table L.1-1, Responses to Common Comments, in the Final EIS.
3	Table 3.3-2 in the DEIS, should be changed to include an accurate parcel count, all GT condo parcels should be included. The S 336th Street site has 19 tax parcels; The S 344th Street site has 109 tax parcels.	Please see the response to Common Comment 1 in Table L.1-1, Responses to Common Comments, in the Final EIS.
4	The Draft EIS did not mention that The Christian Faith Center may want to sell the property. Sound Transit needs to be in conversation with The Christian Faith Center to confirm their desire to sell the property.	Sound Transit has notified all property owners who would be potentially directly affected by the OMF South build alternatives, including the Christian Faith Center. Subsequent to the 2021 Draft EIS, FTA approved and the Sound Transit Board authorized (Resolution Number R2023-26) a hardship acquisition of the four parcels associated with the Christian Faith Center. The purpose of this type of acquisition is to alleviate a particular hardship to the owner when the property owner can document on the basis of health, safety, or financial reasons that remaining in the property poses an undue hardship compared to others. Hardship acquisitions do not limit the evaluation of alternatives required under the NEPA process. No development on the parcels would occur until after FTA issues a ROD and if the Sound Transit Board selects to build the Preferred or South 344th Street alternatives.
5	The S 344th Street site is close to the South Federal Way Station and therefore should be considered for Transit oriented development and not considered for the OMF South.	Please see the response to Common Comment 1 in Table L.1-1, Responses to Common Comments, in the Final EIS. The OMF would provide a vital support function to the entire Link light rail system. The proposed alternative site locations are appropriate for transit-related use.
6	No mention of possible EPA or other Federal or State Grants to lower cost of the Landfill site.	Please see the response to Common Comment 5 in Table L.1-1, Responses to Common Comments, in the Final EIS.
7	Many of the sections of the Draft EIS included numbers and language that included information about the Main Line Extension which made it difficult to look at differences between the S 336th Street site and the S 344th Street sites.	Because the Midway Landfill Alternative does not include mainline track construction, the EIS was organized to differentiate between impacts associated with the OMF South facility and those associated with the required mainline connecting track. The impacts associated with construction and operation of the OMF are listed separately from the impacts associated with the mainline to allow an easier comparison among the three site alternatives. Table ES-1 summarizes the key characteristics and impacts of the alternatives and was updated in the 2023 Draft EIS and this Final EIS to show total impacts of the OMF sites and mainline track, where applicable.

Public Communication: Public Comments to Sound Transit Against the Garage Town Site, Submitted by 5 Commenters		
Comment ID	**Comment Text**	**Response**
8	The Draft EIS did not clearly say that there will be significantly fewer truck trips and less site work on the S 336th Street site. The site work on the S 336th Street site has the lowest impact of all three sites.	Table 3.2-12 of the 2023 Draft EIS and this Final EIS summarizes forecast peak daily truck trips. The South 336th Street Alternative would have more peak daily truck trips than the Midway Landfill Alternative Platform design option but fewer peak daily truck trips than the Midway Landfill Alternative Hybrid and Full Excavation design options and the South 344th Street Alternative.
9	The Full Excavation option for the Midway Landfill site, is not much more costly than the other sites and has fewer negative impacts. This site is favored by most Cities and individuals, and should be selected as the preferred OMF Site.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
10	GT cannot be rebuilt in King County at a reasonable cost received from Sound Transit. There is no existing property in King County like GT. Community would be destroyed. It would be extremely difficult and cost prohibitive to relocate the Ellenos Yogurt facility and maintain delivery to customers. If the South 344thStreet site is chosen Ellenos Yogurt would go out of business.	Please see the response to Common Comment 1 in Table L.1-1, Responses to Common Comments, in the Final EIS.
11	The Executive Summary of the DEIS reflects that the environmental impacts of the 336thSite and the S 344thsites are about the same. It does not reflect that the selection of the 344thSite would require the conversion of the Washington DOT Reserve Conservation Area and retention pond adjacent to I-5 being relocated to an additional parcel to the south of 344th street, which is not included in many of the site maps for The 344th site.	WSDOT Resource Conservation Areas are shown and discussed in Section 3.7, Visual and Aesthetic Resources, of the 2023 Draft EIS and this Final EIS. The mainline tail tracks associated with the South 344th Street Alternative would impact the two Resource Conservation Areas. During final project design, Sound Transit would incorporate specific measures to mitigate impacts to the Resource Conservation Areas, consistent with the WSDOT Roadside Policy Manual. The manual requires that “mitigation for lost or damaged RCAs must consist of an equal value exchange that provides appropriate performance values identified in the manual.” This includes replacing RCA land impacted by the project as well as replanting that land. The manual includes permanent irrigation requirements for impacted RCAs and specific plant establishment criteria. Relocation of the WSDOT stormwater pond is discussed in Section 3.11, Water Resources.
12	The Draft EIS states, on page 3.6-9: “The South 344th Street alternative would impact the most social resources and would have the greatest number of business and residential displacements as compared with the other build alternatives.” This statement of fact was not in the DEIS Executive Summary, and it should be included.	Table ES-1 in the Final EIS Executive Summary includes a comparison of key characteristics and impacts of all three build alternatives. Within the table, the Acquisitions subsection contains the total number of displaced businesses and residences, and the Environmental Justice, Social Resources, Community Facilities, and Neighborhoods subsection contains the number of displaced social and community resources. Additionally, Figure ES-9 and the associated Acquisitions, Land Use, and Economics text within Section ES.3, Comparison of Alternatives of the Executive Summary expands on these impacts.

Public Communication: Public Comments to Sound Transit Against the Garage Town Site, Submitted by 5 Commenters		
Comment ID	**Comment Text**	**Response**
13	Existing street improvements to the S 344th Street site, not adequate to serve the OMF. Significant improvements to S 344th and S 342nd streets would have to be made. This issue was not addressed in the DEIS	It is assumed the comment refers to S 341st Place rather than S 342nd Street, which is outside the study area. The South 344th Street Alternative would eliminate public access to S 344th Street east of 16th Avenue S. The roadway and intersections between SR 99 and 16th Avenue S are forecast to operate similarly to the existing and 2042 No-Build Alternative conditions in both the AM and PM peak periods. Due to this, no mitigation is required. S 341st Place would be vacated under the South 344th Street Alternative. Additional information about existing and forecast traffic operations is available in Section 3.2, Transportation, and Appendix G1, Transportation Technical Report, of the 2023 Draft EIS and this Final EIS.

Members of the Sound Transit Board,

I have read the Draft EIS Statement for your OMF South facility. Based on your research, selecting the S 344th Street site would eliminate over 248 jobs from the community, evict 3 churches, level more than 67 affordable homes, and erase 12 small businesses and the last industrial blue-collar jobs in Federal Way. Our community cannot afford to lose this neighborhood.

Please consider the other sites instead of this one. This is an easy choice, backed up by your data, that I expect you to make to benefit our community.

Thank you.

Peter Broda

April 15,2021

OMF South, c/o Hussein Rehmat
Sound Transit
401 S. Jackson Street
Seattle, WA 98104

RE: Sound Transit Operations and Maintenance Facility South
Environmental Impact Statement Comments

Mr. Rehmat:

I have reviewed the Draft EIS documents for the Operations and Maintenance Facility - South and strongly encourage the Sound Transit Board to select the Midway Landfill site for the new facility. However, if the Midway Landfill site is not chosen, the South 336th Street site is the next best option. Section 3.6.2.2 of the DEIS on page 3.6-9 states:

"The South 344th Street alternative would impact the most social resources and would have the greatest number of business and residential displacements as compared to the build alternatives."

Additionally, the South 344th Street site would have the greatest impact to the local tax revenue. Property owners are already paying taxes to Sound Transit and any loss of revenue further impacts the residents in the City of Federal Way.

The DEIS makes many assumptions. The DEIS should include a table of assumptions for each of the sites and all alternatives made by Sound Transit staff and consultants. This would help the public and the Sound Transit Board understand how the alternatives were analyzed in the draft DEIS and identify potential cost savings vs. the significantly large estimates in the DEIS. For example, the DEIS assumes waste removal from the Midway Landfill could only occur from May through September creating an extremely long construction duration leading to increased costs. Identify all assumptions for each alternative

The DEIS also estimated employee displacements based on assumptions for each alternative. Employee displacement numbers shown in the DEIS are based on square footage of floor space, not actual numbers. In fact, the S. 344th site would displace Ellenos Yogurt, and not only their current employees, but additional jobs that are anticipated when Ellenos expands to a 24-hour operation by the end of 2022. This should be included in the analysis. The assumptions in the DEIS do not take this into consideration. The DEIS states a suitable location for Ellenos can be found if the S. 344th alternative is selected. However, as noted in the letter from EllenosYogurt dated March 26, 2021:

"Equally important, it would take a minimum of a year to ensure a new facility will efficiently and effectively produce product that meet safety and quality parameters essential to remaining competitive and financially stable. The myriad of steps required represent a 2+ year process when an organization has the excess staffing to operate two facilities and assumes the project does not encounter unexpected setbacks, which pragmatically speaking, is not likely to be the case."

The Sound Transit Board has an opportunity to select a site that makes the most sense for the region. The Midway Landfill site offers the following benefits:

1) The Midway Landfill site is mostly vacant property.
2) The Midway Landfill site has the fewest displacements of employees.
3) The Midway Landfill site has minimal business displacement.
4) The Midway Landfill site impacts zero residences.
5) The Midway Landfill site does not impact streams.
6) The Midway Landfill site does not impact wetlands.
7) The Midway Landfill site has the lowest impact on forest resources. The forest impacts identified on the Midway Landfill site should not be considered forest.
8) And very significantly, the Midway Landfill has the least impacts on local tax revenue to the local community.

When comparing the South 344th Street and South 336th Street Alternatives, there is no question the 344th site should NOT be selected.

1) The 344th Street site would have the most residential displacements
2) The 344th Street site would displace five times as many businesses.
3) The 344th Street site would displace well over twice as many employees, and that does not include the proposed expansion at Ellenos Yogurt in 2022.
4) The 344th Street site would have a significantly larger impact on the local tax revenue in a jurisdiction that is already paying into the Sound Transit taxing district.

I encourage the Sound Transit Board to be bold and make the right decision. Challenge your staff to eliminate the assumptions in the Draft EIS, to identify the real cost of the OMF-S on the Midway Landfill site. Local and regional plans are required to look at long term benefits and impacts in the planning process. The OMF-S is a facility that will likely be functional for over a century and will have long term impacts. Certainly, the least impactful location to any community is Midway Landfill and that is best for the region. Of the two sites located within the City of Federal Way, the South 334th St. should be eliminated from consideration.

Sincerely,
Patrick Haigh

Public Communication: Sound Transit Operations and Maintenance Facility South, Submitted by 23 Commenters		
Comment ID	**Comment Text**	**Response**
1	I have reviewed the Draft EIS documents for the Operations and Maintenance Facility – South and strongly encourage the Sound Transit Board to select the Midway Landfill site for the new facility. However, if the Midway Landfill site is not chosen, the South 336th Street site is the next best option.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	Section 3.6.2.2 of the DEIS on page 3.6-9 states: "The South 344th Street alternative would impact the most social resources and would have the greatest number of business and residential displacements as compared to the build alternatives." Additionally, the South 344th Street site would have the greatest impact to the local tax revenue. Property owners are already paying taxes to Sound Transit and any loss of revenue further impacts the residents in the City of Federal Way.	Section 3.5, Economics, in the 2023 Draft EIS and this Final EIS addresses potential changes to total taxable assessed valuation in Table 3.5-6. The South 344th Street Alternative would have the largest acquired jurisdiction taxable share (0.91 percent as compared to 0.53 percent for the Preferred Alternative and 0.11 percent for the Midway Landfill Alternative).
3	The DEIS makes many assumptions. The DEIS should include a table of assumptions for each of the sites and all alternatives made by Sound Transit staff and consultants. This would help the public and the Sound Transit Board understand how the alternatives were analyzed in the draft DEIS and identify potential cost savings vs. the significantly large estimates in the DEIS. For example, the DEIS assumes waste removal from the Midway Landfill could only occur from May through September creating an extremely long construction duration leading to increased costs. Identify all assumptions for each alternative	The assumptions for each alternative are discussed throughout the EIS within the affected environment and environmental impacts section for each element of the environment. This allows for the assumptions specific to each discipline to be alongside the discussion of impacts.
4	The DEIS also estimated employee displacements based on assumptions for each alternative. Employee displacement numbers shown in the DEIS are based on square footage of floor space, not actual numbers. In fact, the S. 344th site would displace Ellenos Yogurt, and not only their current employees, but additional jobs that are anticipated when Ellenos expands to a 24-hour operation by the end of 2022. This should be included in the analysis. The assumptions in the DEIS do not take this into consideration.	Please see the response to Common Comment 1 in Table L.1-1, Responses to Common Comments, in the Final EIS.

Public Communication: Sound Transit Operations and Maintenance Facility South, Submitted by 23 Commenters		
Comment ID	Comment Text	Response
5	The DEIS states a suitable location for Ellenos can be found if the S. 344th alternative is selected. However, as noted in the letter from Ellenos Yogurt dated March 26, 2021: "Equally important, it would take a minimum of a year to ensure a new facility will efficiently and effectively produce product that meet safety and quality parameters essential to remaining competitive and financially stable. The myriad of steps required represent a 2+ year process when an organization has the excess staffing to operate two facilities and assumes the project does not encounter unexpected setbacks, which pragmatically speaking, is not likely to be the case."	Section 3.3, Acquisition, Displacements, and Relocations, of the 2023 Draft EIS and this Final EIS, acknowledges that some properties, including Ellenos Yogurt, could be challenging to relocate.
6	7) The Midway Landfill site has the lowest impact on forest resources. The forest impacts identified on the Midway Landfill site should not be considered forest.	As described in Section 3.10, Ecosystem Resources, of the 2023 Draft EIS and this Final EIS, biologists identified 10 different vegetation cover types in the study area, including the following three forest types: non-native forest, mature native forest, and other native forest. Biologists identified approximately 1 acre of non-native forest and 4 acres of other native forest impacts for the Midway Landfill Alternative. The majority of the site is grassland, and most of the impacts (57 acres) would be to that vegetation type.
7	When comparing the South 344th Street and South 336th Street Alternatives, there is no question the 344th site should NOT be selected.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.

RE: OMF South Scoping

I am writing to you in **opposition** of an OMF being built along/at 20th Ave. S. Federal Way or 16th Ave. South.

The current zoning at the Christian Faith Center (CFC) is multi-family. Zoning for the OMF at the 20th Ave. South site would require Heavy Industrial Equipment (HEI). Heavy equipment zoning is **not** tolerated so close to the protected **Hylebos Creek** as it lies within a **Resource Protection Area**.

The proposed site at 16th Ave. South is **zoned** as Business Park, also not HIE. Residential neighborhoods which pre-exist before the Business Park zoning in the area have persisted as a single-family residential area for more than two decades.

Ellenos Yogurt is the largest employer in the city of Federal Way. The OMF would displace this business. This company has spent over five million dollars upgrading their facility in the last few years. They and the other surrounding businesses should not have to vacate, especially in today's climate, where small businesses are struggling to survive. We are proud of this local business and they have our full support.

The collective impacts to businesses/residents in Federal Way from Sound Transit are extensive. The presence of your facilities/stations/lines/link should not be wherever one happens to be in Federal Way.

Sound Transit, find another location for your OMF.

Both of the mentioned sites have portions of the **Hylebos Waterway** within them. Federal Way has inventoried and classified these creeks as **MAJOR STREAMS**. The **Hylebos** is listed as **Class A Waters** under **State Water Quality Standards**.

During the construction of the church in 2004, 35,936 sq.ft. of wetlands were displaced/filled in order to create the largest church campus in the state. This area is a part of the International Flight Pathway. **Over 150 migratory birds depend on the Hylebos and the surroundings for rest, food, and water**. The Resource Protection Area would be eliminated/buried if the link line is not elevated, as it is in direct line of the Hylebos. **This land cannot tolerate any more abuses or alterations**. The allotted percentage for this space to be developed was taken 20 years ago. This land needs to remain as is.

The headwaters for the East Branch of the Hylebos are received via North Lake, less than 1/8 of a mile from this proposed site. **These waters are paramount for downstream juvenile salmon recovery. Macrobenthic invertebrates must travel freely along trees, rocks and water.** Culverting the Hylebos at this critical junction goes against the entire purpose of the Executive Proposed Hyebos and Lower Puget Sound Watershed Plan. This document created in the 1990s is a roadmap for thoughtful development around the Hyleobs. Allowing not only the link line, but the extra line of track to reach OMF, on top of an OMF, at either site in Federal Way is utterly mind-boggling in regard to environmental impacts. The residents of Federal Way remember the planning process for the church, vividly! It took four years to finally settle on a compromise and protections for the waterway. The citizens of Federal Way will not allow your facility to be built here. The once-beautiful forest with its inhabitants was taken from us once. Any further manipulations to the property will destroy what is left of the wetland connectivity and water quality in the East Branch of the Hylebos.

Sound Transit please find another location for your OMF.

The Midway Landfill is the most obvious choice and one we support, although the cost and time may make this a nonviable option. In that instance, could you please revisit your #1 (S. 352nd St.) & #4 (Fife) site options that WERE discussed 2017?

Both of these options are landfills that received toxic dumping from Boeing and the Asarco. Site #1 is an environmental nightmare because this land was never created to serve or function as a landfill, nor was this dumping site closed properly. The petroleum pipeline that runs parallel with I-5 also runs through a portion of this land. This line was installed with NO protective barriers. **The line now serves as a conduit for leachates and aids their distribution into our aquifer/ Hylebos watershed.**

Couldn’t this be a win-win for the environment, residents, and Sound Transit?

If Sound Transit is willing to tackle the Midway landfill, surely other landfill sites could be another viable option. It is up to Sound Transit to work with the public. It is Sound Transit who needs to find other solutions. Sound Transit MUST do its due diligence and exhaust all possibilities. The citizens of Federal Way will not accept another major disruption to our city.

Sound Transit please find another site for your OMF.

The citizens of Federal Way have spent the last five years striving to protect and preserve the former Weyerhaeuser Campus that lies just East of these proposed sites. We have fought against the unprecedented traffic impacts that will result if the Campus is fully built out. With Highway 18 and 320th St. at maximum failure today, the S. 336th Street offers residents a way to reach our city establishments. **The Supreme Court recently ruled that the City of Federal Way and IRG WILL adhere to the Executive Proposed Hylebos Watershed Plan**, as well as view any developments through cumulative eyes in regard to environmental impacts. The church site demands this total lens as it is a part of the original Weyerhaeuser Campus/Forest. Our city is already being accommodating for the link line and transfer stations being built along 320th. How much more will Federal Way have to endure?

We will not allow Sound Transit to hold us hostage for the next 10 years. You must work with the citizens of Federal Way. Mayor Strong leaves our Council members and citizens very little voice in how our city functions. Sound Transit is NOT the city of Federal Way and we citizens should be heard and respected as our concerns are valid.

Sound Transit told citizens in print as well as at Zoom meetings that this was not a “done deal.” One of your representatives (along with FW council members) has stated that the decision HAS been made to put the OMF at either FW sites. This certainly shows a **serious conflict of interes**t and one that needs to be made transparent to all going forward. Sound Transit is said to be misleading and confuses the public. For instance: staging public meetings and telling the public their input is needed and valued, only to find out events are for trivial items like art installations. Sound Transit then takes public input on Art and transfers that into dialogue and discussion on the important items like an OMF. Transparency is vital and should be upheld to the highest standards.

I respectfully submit these comments and expect fully to be engaged with the community and Sound Transit going forward. I am confident a better solution for your facility can and will be found. It must not be within the city limits.

Thank you for your time and thoughtful consideration.
Sincerely,
Trina Ballard Southern

1	I am writing to you in opposition to the Operations and Maintenance Facility (OMF) being built along/at 20th Ave. S. Federal Way or 16th Ave. S.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	The current zoning at the Christian Faith Center (CFC) is multi-family. Zoning for the OMF at the 20th Ave. South site would require Heavy Industrial Equipment (HEI). Heavy equipment zoning is not tolerated so close to the protected Hylebos Creek as it lies within a Resource Protection Area. The proposed site at 16th Ave. South is zoned as Business Park, also not HIE. Residential neighborhoods which pre-exist before the Business Park zoning in the area have persisted as a single-family residential area for more than two decades.	As a regional transit authority facility, OMF South is considered an Essential Public Facility under Revised Code of Washington 36.70A.200, which is allowable under any zoning. As stated in Section 3.4, Land Use, of the 2023 Draft EIS and this Final EIS, OMF South is generally consistent with the city of Federal Way Comprehensive Plan as well as the intent of the zones that it would occupy within the footprints of the South 336th Street and South 344th Street alternatives. Sound Transit acknowledges that light rail transit facility uses are explicitly recognized only in the portions of the site zoned City Center Core (CC-C) and Commercial Enterprise (CE). Where the use is not explicitly recognized, Sound Transit would continue to meet zoning code and intent to the maximum extent practicable during the land use approval process. As with any development, construction and operation of OMF South would be subject to environmental regulations and permitting requirements meant to protect environmentally sensitive areas, such as streams and wetlands, that could be affected by the project. Please see Section 3.10, Ecosystem Resources, for more information.
3	Ellenos Yogurt is the largest employer in the city of Federal Way. The OMF would displace this business. This company has spent over five million dollars upgrading their facility in the last few years. They and the other surrounding businesses should not have to vacate, especially in today’s climate, where small businesses are struggling to survive.	Sound Transit acknowledges that Ellenos Yogurt is a unique facility that would be challenging to relocate. This is described in Section 3.3, Acquisitions, Displacements, and Relocations of the 2023 Draft EIS and this Final EIS.
4	Both of the mentioned sites have portions of the Hylebos waterway within them. Federal Way has inventoried and classified these creeks as MAJOR STREAMS. The Hylebos is listed as Class A Waters under State Water Quality Standards. During the construction of the church in 2004, 35,936 sq.ft. of wetlands were displaced/filled in order to create the largest church campus in the state. This area is a part of the International Flight Pathway. Over 150 migratory birds depend on the Hylebos and the surroundings for rest, food, and water. The Resource Protection Area would be eliminated/buried if the link line is not elevated, as it is in direct line of the Hylebos. This land cannot tolerate any more abuses or alterations. The allotted percentage for this space to be developed was taken 20 years ago. This land needs to remain as is.	Please see the response to Common Comment 3 in Table L.1-1, Responses to Common Comments, in the Final EIS.

5	The headwaters for the East Branch of the Hylebos are received via North Lake, less than 1/8 of a mile from this proposed site. These waters are paramount for downstream juvenile salmon recovery. Macrobenthic invertebrates must travel freely along trees, rocks and water. Culverting the Hylebos at this critical junction goes against the entire purpose of the Executive Proposed Hylebos and Lower Puget Sound Watershed Plan. This document created in the 1990s is a roadmap for thoughtful development around the Hylebos. Allowing not only the link line, but the extra line of track to reach OMF, on top of an OMF, at either site in Federal Way is utterly mind-boggling in regard to environmental impacts. Any further manipulations to the property will destroy what is left of the wetland connectivity and water quantity in the East Branch of the Hylebos.	Please see the response to Common Comment 3 in Table L.1-1, Responses to Common Comments, in the Final EIS. Section 3.10, Ecosystems, and Appendix G.3, Ecosystems Technical Report, of the 2023 Draft EIS and this Final EIS provide information about the East and West Fork Hylebos tributaries and potential project impacts to those streams.
6	The Midway Landfill is the most obvious choice and one I support. Although the cost and time may make this an unviable option.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
7	In that instance, could you please revisit your #1 (S. 352nd St.) & #4 (Fife) site options that WERE discussed 2017? Both of these options are landfills that received toxic dumping from Boeing and the Asarco. Site #1 is an environmental nightmare because this land was never created to serve or function as a landfill, nor was this dumping site closed properly. The petroleum pipeline that runs parallel with I-5 also runs through a portion of this land. This line was installed with NO protective barriers. The line now serves as a conduit for leachates and aids their distribution into our aquifer/ Hylebos watershed. Couldn’t this be a win-win for the environment, residents, and Sound Transit? If Sound Transit is willing to tackle the Midway landfill, surely other landfill sites could be another viable option.	In 2019, Sound Transit conducted an extensive alternative site assessment process that resulted in the Sound Transit Board identifying the Midway Landfill, South 336th Street, and South 344th Street alternatives for study in the Draft EIS. More information can be found in the OMF South Alternatives Evaluation Technical Memorandum (https://www.soundtransit.org/sites/default/files/documents/operations-and-maintenance-facility-south-alternatives-evaluation-technical-memorandum.pdf).
8	Sound Transit told citizens in print as well as at Zoom meetings that this was not a “done deal.” One of your representatives (along with FW council members) has stated that the decision HAS been made to put the OMF at either FW sites. This certainly shows a serious conflict of interest and one that needs to be made transparent to all going forward.	On December 16, 2021, the Sound Transit Board identified the South 336th Street site as the Preferred Alternative for OMF South. The Board’s identification of a preferred alternative is not a final decision. The Sound Transit Board will select the project to be built after publication of the Final EIS.

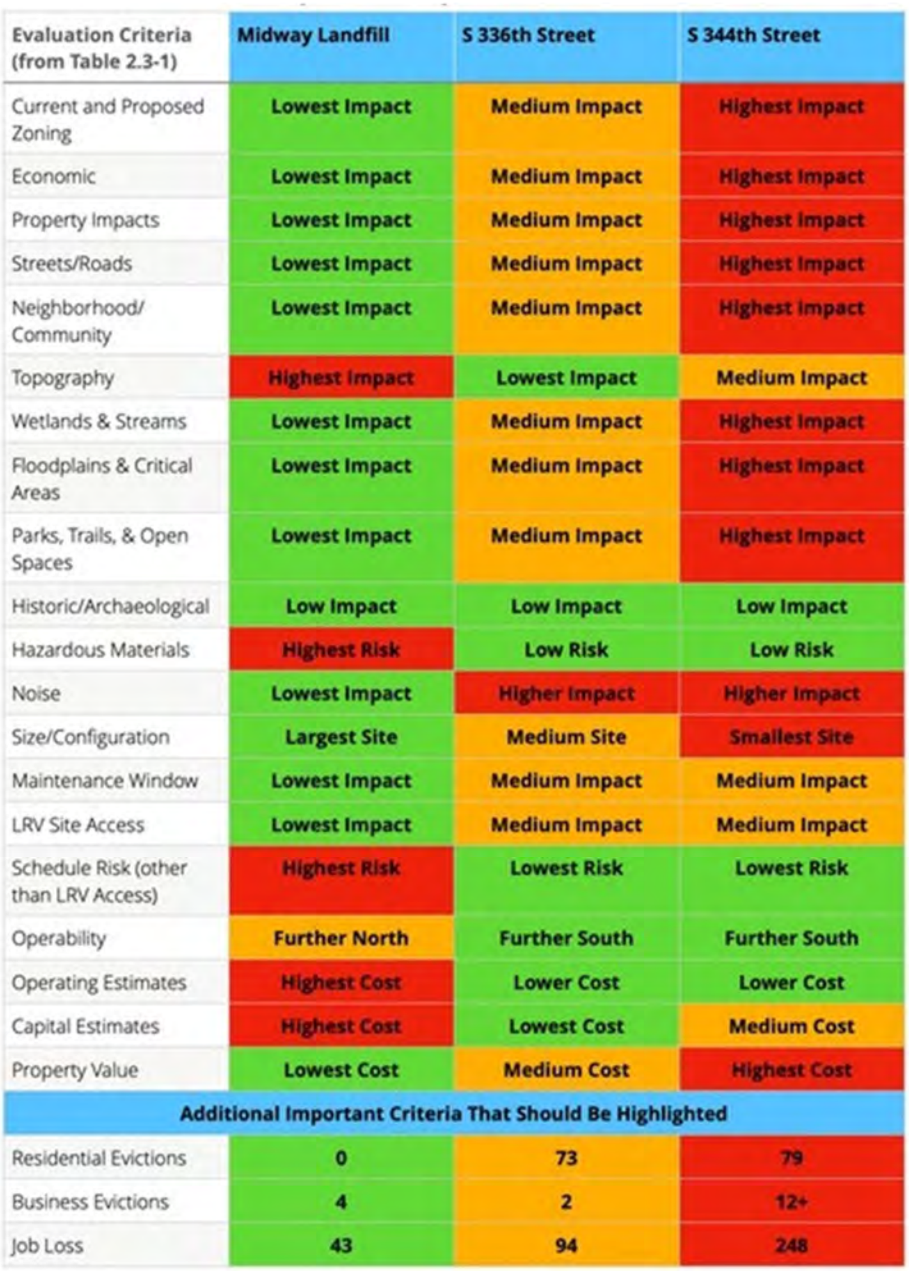
Members of the Sound Transit Board,

Dick's Drive Inn was previously eliminated from consideration as an alternative site due to public perception and negative impacts. Please now eliminate the S. 344th for the same exact same reasons. Of the three alternatives It is the highest negative impacts to property owners, City of Federal Way and local employees who will lose their jobs.

The negative impacts for each alternative site as documented by your own Draft EIS Statement are summarized here.



Evaluation Criteria (from Table 2.3-1)	Midway Landfill	S 336th Street	S 344th Street
Current and Proposed Zoning	Lowest Impact	Medium Impact	Highest Impact
Economic	Lowest Impact	Medium Impact	Highest Impact
Property Impacts	Lowest Impact	Medium Impact	Highest Impact
Streets/Roads	Lowest Impact	Medium Impact	Highest Impact
Neighborhood/ Community	Lowest Impact	Medium Impact	Highest Impact
Topography	Highest Impact	Lowest Impact	Medium Impact
Wetlands & Streams	Lowest Impact	Medium Impact	Highest Impact
Floodplains & Critical Areas	Lowest Impact	Medium Impact	Highest Impact
Parks, Trails, & Open Spaces	Lowest Impact	Medium Impact	Highest Impact
Historic/Archaeological	Low Impact	Low Impact	Low Impact
Hazardous Materials	Highest Risk	Low Risk	Low Risk
Noise	Lowest Impact	Higher Impact	Higher Impact
Size/Configuration	Largest Site	Medium Site	Smallest Site
Maintenance Window	Lowest Impact	Medium Impact	Medium Impact
LRV Site Access	Lowest Impact	Medium Impact	Medium Impact
Schedule Risk (other than LRV Access)	Highest Risk	Lowest Risk	Lowest Risk
Operability	Further North	Further South	Further South
Operating Estimates	Highest Cost	Lower Cost	Lower Cost
Capital Estimates	Highest Cost	Lowest Cost	Medium Cost
Property Value	Lowest Cost	Medium Cost	Highest Cost
Additional Important Criteria That Should Be Highlighted			
Residential Evictions	0	73	79
Business Evictions	4	2	12+
Job Loss	43	94	248

As you can see S 344th site has the most negative impacts by a very large margin. Please eliminate the S. 344th from further consideration. This is an easy choice, backed up by your data, that I expect you to make to benefit our community.

Thank you.

Subject: ST South Maintenance Facility - 344th Street option

Original communication comments, March 13, 2019 with updates to selected paragraphs for current conditions.

Site investigation committee,

Site Issues and background as they relate to 1910 South 344th Street and 1934 South 344th Street parcels, included in Option 344th Street:

- Donna and Greg Olson purchased, rezoned and developed the parcels in 1988/89. We installed water mains and sanitary sewer from locations on 344th Street near Garagetown allowing easy connection to future development on the specific surrounding properties. Our property is 2.93 useable acres.
- Donna and Greg Olson's trucking company, Evergone, Inc., operated its 100+ employee long haul postal contracting operation from the site from 1989 through 6/30/2008, our retirement.
- Donna and Greg Olson continue to own the parcels and have leased them to unrelated third parties since 7/1/2008. Each tenant since then has employed between 50-200 employees.
- The current tenant is Potelco, Inc, a wholly owned subsidiary of Quanta Services, an $8 billion in annual sales firm that concentrates in power and energy transmission and repair across the USA.
- Potelco has a lease right to utilize our property until 7/31/2028. The "capitalized value of the lease payments", which is a primary determinant of property value in real estate, likely far exceeds your estimate of property value. Also, since our previous communication date with the site committee on March 13, 2019, both Potelco and us as landlords have made some significant capital expenditures to improve the property which would need to be calculated in a valuation.
- We would likely be at risk for significant legal costs should we be forced to terminate the current lease. Additionally, should Potelco attempt to terminate the lease due to uncertainty about remaining at our site we would also incur substantial legal costs and loss of our primary source of income, a significant factor in our financial position.
- Potelco utilizes this site as their primary south sound terminal for repair and construction activities. We were told our location provided them with strategic advantages in performing their contractual services to PSE.
- Donna and Greg Olson have been approached by numerous interested buyers since ownership and currently have an "offer to buy" awaiting our decision to accept should we choose to accept the current purchase offer. This buyer has verbally increased his offer by 12% since first made in writing and communicated to the site committee on March 13, 2019.
- As recent as mid-February 2021, it was communicated to Greg by two brokers from different firms that they had clients that would be interested in leasing our property, if available. It was stated that the characteristics of our property are becoming very scarce in the south sound. This is consistent with Greg's discovery during diligent review, since 2007, of the south sound properties with similar characteristics to ours, Greg has learned that the number of available parcels is dwindling, which has made our parcel considerably more desirable to possible tenants seeking such property characteristics: substantially all paved, fully fenced and secured, zoning compliant, approved and installed storm sewer system, proper installation of an oil/water separator utility, well maintained structure with excellent access to major freeways. It would be extremely difficult for us to locate and purchase a comparable property to what we have owned since 1988 and that provided the current rental income we receive.

- Additionally, we have been contacted in the last seven years by a developer for construction of a major hotel and a developer looking for a location for a mid to high level luxury condominium project. We enjoy one of the nicer views of Mt Rainier available in the Federal Way area. In our opinion a hotel or residential condo development would be a better future use for our property and consistent with the available retail businesses nearby.
- The companies which have utilized our property since 1989 have been a significant contributor to the economy of the City of Federal Way and the south sound.

Specific property characteristics:

- Our elevation is likely 40+ feet higher than Garagetown to the east; standing on our property it's easy to see over the roof of the Garagetown units. Btw, Garagetown units are ~60 individually owned units, not a "single owner" rental.
- Approximately 8-10' under the surface on our property we have struck extremely hard "glacial till soil" when installing our 12,000 gallon underground fuel tank (which remains on the site) and the Phase III test holes we have required of each prior tenant at the end of their lease term.
- The property is substantially paved with good quality asphalt, a fully operational and approved underground storm sewer system with associated catch basins. The property is fully fenced, contains a two story 6,400 sq ft, very well maintained office and shop structure. The fuel island and shop facility is connected to a maintained oil/water separator system before discharging into the sanitary sewer. All site systems and utilities were constructed under King Co, BALD guidelines as one of the final 17 developments in process when Federal Way became a city.

Surrounding properties:

- To the west of our property are located numerous single family homes, most of which are well maintained and of the lower price range for which are affordable for the current residents. It is very likely these residents would have a very difficult time securing alternate affordable housing. We believe these residences remain on septic however could be connected to sewer on 18th.
- To our north is the prior Trinity Broadcasting station tower, currently occupied by a religious organization/church. Also, to the north is the Insurepass/Intellipass office building which I believe is leased to various users.
- To our east is a location owned and utilized by Gene's Towing and the Garagetown complex with ~60 individual residential accessory property owners. It is my opinion these owners would find it very difficult to secure alternate facilities to what they currently own and in a similar proximity to their residences.
- To the south is the Walmart superstore and numerous retail and service businesses, locating a transit repair facility so close to those business seems to me to be an inconsistent use or our property and conflict with the goals of the City of Federal Way based upon our past discussions with city officials.

In conclusion I can be reached by email, phone or in person to discuss any of these, or additional issues as needed in the selection process.

Thank you,

Comment ID	Comment Text	Response
1	Potelco has a lease right to utilize our property until 7/31/2028. The "capitalized value of the lease payments", which is a primary determinant of property value in real estate, likely far exceeds your estimate of property value. Also, since our previous communication date with the site committee on March 13, 2019, both Potelco and us as landlords have made some significant capital expenditures to improve the property which would need to be calculated in a valuation. -We would likely be at risk for significant legal costs should we be forced to terminate the current lease. Additionally, should Potelco attempt to terminate the lease due to uncertainty about remaining at our site we would also incur substantial legal costs and loss of our primary source of income, a significant factor in our financial position.	As described in Section 3.3, Acquisitions, Displacements, and Relocations of the 2023 Draft EIS and this Final EIS, as a public agency, Sound Transit must pay just compensation to property owners for land and improvements acquired for public purposes. Determination of just compensation is based on an independent appraisal and appraisal review and must not be less than the fair market value of the property acquired. Sound Transit would work with qualified commercial appraisers to consider all elements contributing to the real estate value of your property as well as any leasehold interests.
2	Surrounding properties: -To the west of our property are located numerous single family homes, most of which are well maintained and of the lower price range for which are affordable for the current residents. It is very likely these residents would have a very difficult time securing alternate affordable housing. We believe these residences remain on septic however could be connected to sewer on 18th. -To our north is the prior Trinity Broadcasting station tower, currently occupied by a religious organization/church. Also, to the north is the Insurepass/Intellipass office building which I believe is leased to various users. -To our east is a location owned and utilized by Gene's Towing and the Garagetown complex with ~60 individual residential accessory property owners. It is my opinion these owners would find it very difficult to secure alternate facilities to what they currently own and in a similar proximity to their residences. -To the south is the Walmart superstore and numerous retail and service businesses, locating a transit repair facility so close to those business seems to me to be an inconsistent use or our property and conflict with the goals of the City of Federal Way based upon our past discussions with city officials.	Section 3.3, Acquisitions, Displacements, and Relocations, and Appendix E, Environmental Justice, of the 2023 Draft EIS and this Final EIS, provide information on how Sound Transit would compensate and assist all displaced residents, property owners, and businesses, including those residents who rent or who require affordable housing, according to the Sound Transit Real Property Acquisitions and Relocation Policy, Procedures, and Guidelines and in accordance with state relocation and property acquisitions laws.

The Midway landfill is the best possible location for OMFS. The OMF, an industrial operations and maintenance facility benefiting the public would be the best possible use for this vacant, superfund designated public land. Who better to utilize and manage and steward the risks than an tax funded agency!? The minimal impact at midway landfill to the cities, businesses, residents, and environmental concerns compared to the other 2 alternatives justifies the increased cost of construction. Provided sound transit is better stewards of taxpayer dollars than their history demonstrates... there is no reason to negatively impact more people, up end more jobs, homes, lives, tax base, multiple roads and a church. All while having greater environmental impacts in disturbing riparian zones. Tax payers are already being bled dry, despite our votes for cheaper taxes, you argued eyeman duped us. Ironic since you duped us all into voting for the absurdly expensive program you consistently fail at keeping in budget... Pot...kettle... but, since you've managed to maintain the outrageous taxes on us despite our votes... The least you could do is eminent domain as few businesses and peoples homes as possible through this process. The skilled trade and support staff jobs being created by OMFS do not replace the jobs you will otherwise take from people. Your appraisal value offers are garbage compared to an actual fair market value people could make if they sold their homes or businesses fairly without threat of being eminant domained. Not to mention demolishing pillars of the local community. (Churches)

All options considered, all costs and benefits weighed, midway land fill needs to be selected as the best possible location for the OMFS. It is lowest overall impact and is the only option not requiring additional aerial main line extensions just to be put into service.

Why not the huge empty and treeless
Property by I 5 and north
Of the empty Whehauser property
Sorry about the spelling

John Thompson (Communication ID 471148)		
Comment ID	**Comment Text**	**Response**
1	Why not the huge empty and treeless Property by I 5 and north Of the empty Whehauser property	The property referred to is part of the former Weyerhaeuser campus. This property was evaluated during the OMF South alternatives evaluation process in 2019, and the site was ultimately not carried forward because of high schedule risk and operating estimates due to its location on the east side of I-5. More information can be found in the OMF South Alternatives Evaluation Technical Memorandum (https://www.soundtransit.org/sites/default/files/documents/operations-and-maintenance-facility-south-alternatives-evaluation-technical-memorandum.pdf).

The Midway Landfill option costs more than the other two options, and that is sufficient reason to be opposed to it. I want transit money to be spent on transit benefits, and any benefits of the Midway Landfill site do not benefit transit. With the budget so strained by the pandemic, we cannot afford to spend money unnecessarily. Although the other two options do require expending money to construct track further south, that has a transit benefit.

Members of the Sound Transit Board,

I have read the Draft EIS Statement for your OMF South facility.

Job impacts and tax base shifts are critically important to property owners and the City of Federal Way. Given the relatively small number of property owners (<100) in all three alternative sites, why was a potentially inaccurate estimating approach based on square footage of buildings used to estimate number of jobs impacted? Would not a simple and direct survey of the property owners yield higher quality data for counting actual on-premise employees? I respectfully submit that for the cost of postage stamps an unnecessary and critical ambiguity in the Draft EIS can be remedied.

With construction costs essentially the same for the two Federal Way alternatives, please don’t rely on unnecessarily imprecise estimates for jobs impacted— especially when the actual job impact can be readily determined.

I also respectfully submit that treating GarageTown as a single entity in Draft EIS summary tables detracts from the fair and accurate comparison these tables are intended to provide. Please eliminate the use of footnotes in the Draft EIS that tend to bury the relative weight and interests of 60 distinct GarageTown property owners. Those 60 discrete property owners should be shown directly in the summary tables. Everyone of those owners uses their property for a residential garage or a business location. In assessing the magnitude of impacts to properties, the inclusion of GarageTown as a single property in the Draft EIS is inaccurate and misleading.

Unfortunately both of these two deficiencies in the Draft EIS work to underrepresent the true burden to S 344th site property owners and the community. Given the Draft EIS suggests the relocation options for Garage Town owners are extremely limited I encourage the Board to request a more complete comparison of all property ownership and actual job impacts across all three alternative sites.

Thank you.
Teresa Wagner

Would not a simple and direct survey of the property owners yield higher quality data for counting actual on-premise employees?	The number of displaced employees is based on the business building size (taken from King County Department of Assessment data) and the type of business activity using square-foot-per-employee factors from the U.S. Department of Energy and the Institute for Transportation Engineers. While not on an actual survey of businesses, it allows an equal comparison between alternatives. This methodology is consistent with environmental review being conducted for other current Sound Transit projects.

Regarding the placement of the south repair/storage facility:
Please place it at the MIdway landfill site.
There is currently work being done near there now and you should be able to start coordination with it. If you do not use it, then the site will sit empty and unused. it's the most logical place. Further the mis-placement and degradation of the other areas you propose are a detriment to the area.

thank you,
S

I am a big supporter of public transportation and of Sound Transit's efforts to provide this service to the Puget Sound Area. I live in Federal Way, WA, and I am excited to see the changes in progress.

I have received information about the upcoming choices of location for the South train yard, and I am writing to submit my opinion on this. Of the three choices outlined in the information from Protect Federal Way, I would strongly choose the Midway Landfill location. The other two choices (S. 344th St. and S. 336th St.) are very close to my home and other homes which would be impacted by the noise. Facilities like this should not be near to homes, schools, offices, green spaces, streams and lakes, due to noise and industrial pollution. I would hope that the clearing of homes, business and churches would render those choices off limits. I urge you to choose the Midway Landfill location for these reasons.

Thank you kindly,
Linda Sims

Linda Sims (Communication ID 471304)		
Comment ID	**Comment Text**	**Response**
1	Of the three choices outlined in the information from Protect Federal Way, I would strongly choose the Midway Landfill location.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	The other two choices (S. 344th St. and S. 336th St.) are very close to my home and other homes which would be impacted by the noise. Facilities like this should not be near to homes, schools, offices, green spaces, streams and lakes, due to noise and industrial pollution.	Section 3.9, Noise and Vibration, and Appendix G2, Noise and Vibration Technical Report, of the 2023 Draft EIS and this Final EIS describe the noise assessment Sound Transit conducted for OMF South project alternatives following FTA's Transit Noise and Vibration Impact Assessment Manual (2018). Based on the current design, operation of the OMF site would not cause noise impacts. Operation of the mainline track to the South 336th Street and South 344th Street alternatives would result in noise impacts to some single-family residences, depending on the track design option. However, all noise impacts would be mitigated. During final design, all impacts would be reevaluated to verify impact levels and inform the mitigation design. The operation of OMF South would follow all regulations concerning the proper use and disposal of hazardous materials. No industrial pollution would be generated.
3	I would hope that the clearing of homes, business and churches would render those choices off limits. I urge you to choose the Midway Landfill location for these reasons.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.

Members of the Sound Transit Board,

I have read the Draft EIS Statement for your OMF South facility. Based on your research, selecting the S 344th Street site would eliminate over 248 jobs from the community, evict 3 churches, level more than 67 affordable homes, and erase 12 small businesses and the last industrial blue-collar jobs in Federal Way. Our community cannot afford to lose this neighborhood.

Please consider the other sites instead of this one. This is an easy choice, backed up by your data, that I expect you to make to benefit our community.

Thank you.

It should be the old dumpsite. Best pick for environment and the life of Federal Way

Dear Sound Transit Board,
Many of us would like to see a light rail go to Federal Way. However, land is very scarce in this area. Wouldn't it make a lot more sense to use an old landfill instead of destroying churches, neighborhoods, and small businesses?
Please use some common sense. And please do not speak to me of costs and funding. Your arguments would just sound hypocritical.
Most Sincerely,
Frederick Daniel Cardenas

Dear Board members of the Sound Transit

When it comes to picking a site for the maintenance center i would consider the Midway landfill
I know the cost would be greater, but the transit maintenance center would be considered an industrial
site with a rail yard and maintenance buildings. This site would fit in with current business that currently surround
that area. It is a site that would displaced less current established businesses.
The longer we wait on doing something with this landfill property the more expensive it will be.

Thank You
Jack & Julie Sharlock

I have walked around site 10A talking to businesses & home owners. Some of the businesses have been there for many years & are family owned. A lot of the homes within site 10A have been there for many years. It's also this is the only industrial site the Federal Way has. Elleno's has a huge business within site 10A that has put millions of dollars into it with improvements. They have many employees working there making the worlds best yogurt. I'm an owner within site 10A that Sound Transit is considering for the OMF facility. I'm one of the owners at GarageTown which is an extension of my home. GarageTown is not just another storage facility. I have spent a lot of time & money with improvements in my garage over the years. It is and has been a place where my Grandkids have learned to work on projects and old cars that I own. They always love to come to Grandpa's garage & learn how to work on projects. Sense schools have no classes to teach them wood working, metal shop & automobile mechanics like they had when I grew up. This is teaching them and getting them ready for life after high school or college. There are 67 garages within GarageTown with 57 owners. Within GarageTown there are some businesses that have

employees. If Tacoma can make the Asarco site on the waterfront in to a beautiful and functional place, why can't Sound Transit do the same with the Midway landfill site. Building the OMF site at the Midway landfill would have the least amount of heartbreak for all the citizens in Federal Way. Thank you for your time, Ken Broyles

Subject: OMF South train yard

Hello,

WHY would you choose to displace small businesses, destroy 14 homes (when there are not enough affordable home right now), and take away jobs from people who need them?

Can you think beyond profit and ease of your jobs?

Put the train yard on the landfill site where no one lives and no businesses are operating!!

Vickie Price

Members of the Sound Transit Board,

I have read the Draft EIS Statement for your OMF South facility. Based on your research, selecting the S 344th Street site would eliminate over 248 jobs from the community, evict 3 churches, level more than 67 affordable homes, and erase 12 small businesses and the last industrial blue-collar jobs in Federal Way. Our community cannot afford to lose this neighborhood.

Please consider the other sites instead of this one. This is an easy choice, backed up by your data, that I expect you to make to benefit our community.

Use the Midway landfill space!!

Thank you.

Good afternoon, my name is James Hennessey, my wife and I are residents in Belmor Park, Federal Way. Myself and all the residents of Belmore are very concerned that you will be displacing hundreds of Senior Citizens that are on fixed income. Many of us purchased brand new homes within the past 4 years, without the Park EVER disclosing that it was a strong possibility that Sound Transit would be coming through the park. Reviewing the map of the potential routes from Federal Way to Tacoma, Sound Transit could go around the park without impacting the residents and avoid relocating us. YES, you might have to slow down a bit and lose 2-3 seconds of time, i don't think that's going to impact riders. My question is this, has your office taken into consideration that the residents of Belmor are senior citizens on a fixed income. Where are we going to move to that's affordable? And what about myself and others that just purchased a brand-new home that still has a mortgage? I'm sure there's been a lot of discussion with the owners, The Hynes Group in regards to Sound Transits intentions and plans, unfortunately, the residents of Belmor have had very limited communication from them, in fact we haven't had any updates or communication with them or Management since 2019. On behalf of the residents of Belmor Park, please reconsider coming through our park and find an alternate that wilol not displace us senior citizens.

Thank you,

James & Kathi Hennessey

The alignments of the mainline from the Federal Way Downtown Station to the Preferred and South 344th Street alternatives were identified through early scoping, scoping, and alternatives development processes that included Tribal, agency, and public input for TDLE. Please see Section 2.3, Alternative Development and Scoping, in the Final EIS. All the alternative alignments for the mainline cross through Belmor. The mainline alignments were identified by the need to connect to the end of FWLE, north of Belmor, and had to take into account construction constraints around exiting infrastructure, roadways, and development.

Of the proposed alternatives set forth in the Draft EIS, it is clear that the best alternative is:

Midway Landfill - Full Excavation

It has the least negative impact to homes, businesses, jobs, wetlands, and streams. It also has significant benefits in returning a currently unused site from a community liability into a useful asset.

Construction costs and duration can be accommodated in the overall plan, particularly in light of project realignment currently under consideration. The Midway Landfill site has no risk of increasing real estate prices, and the construction timeframe can be mitigated by both an early start and adjusting the completion date to align with a delayed requirement for service on the southern line extensions.

I strongly encourage you to choose the Midway Landfill - Full Excavation alternative as the Preferred Alternative.

Sincerely,
Edward C. Miller
Federal Way property owner

Of the proposed alternatives set forth in the Draft EIS, it is clear that the WORST alternative is:

South 344th Street

It has the strongest negative impact to homes, businesses, and jobs. Of particular concern is the elimination of a large number of residences and businesses that would be destroyed, including the loss of the Ellenos Yogurt manufacturing facility that is located within the boundary of this alternative.

The other proposed alternatives are clearly better choices. I strongly encourage you to recommend AGAINST choosing the South 344th Street alternative as the Preferred Alternative.

Sincerely,
Edward C. Miller

1	Construction costs and duration can be accommodated in the overall plan, particularly in light of project realignment currently under consideration. The Midway Landfill site has no risk of increasing real estate prices, and the construction timeframe can be mitigated by both an early start and adjusting the completion date to align with a delayed requirement for service on the southern line extensions.	Please see response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS. While changes have been made to the implementation schedule of Sound Transit 3, an OMF in the southern portion of the Link light rail service area is still needed to be operational by 2030. Construction of the Midway Landfill Alternative would not meet that schedule.
2	Of the proposed alternatives set forth in the Draft EIS, it is clear that the WORST alternative is: South 344th Street	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.

Subject: OMF South Best Option

Hello,

Let me identify myself. I am Patricia Pugnetti. I was born and raised in Tacoma. After my marriage in 1973, my husband and I moved to the Federal Way area. Therefore, I call myself a native of the area. I can remember when there was discussion of what to do with the Midway landfill area after it closed. It was known that the landfill would not be available for any type of

normal usage for a period of time because of gas venting and such.

To consider already developed sites containing business, churches, residences, and natural habitat for the OMF site is a counterproductive use of King County land. Public input in prior rounds of comments overwhelmingly supported using the Midway landfill site as the Prime Spot for this OMF facility. At this point that should be loud and clear to Sound Transit.

EPA's Tmeline.

Milestone	**Date(s)**
Initial Assessment Completed	01/01/1983
Proposed to the National Priorities List	10/15/1984
Finalized on the National Priorities List	06/10/1986
Remedial Investigation Started	03/28/1985
Final Remedy Selected	09/06/2000
Remedial Action Started	Not Yet Achieved
Construction Completed	09/21/2000
Deleted from National Priorities List	Not Yet Achieved
Most Recent Five-Year Review	08/28/2020

Now, the time is at hand and the EPA's timeline shows that remediation on the Midway site is completed (see above) and the next step is to remove it from the national priorities list just in time to be used for the OMF project.

Regarding Midway site:

>> Public preferers using this site. Building at this location is done with consent of the governed.

>> Business (jobs), churches, residences and natural habitat are not impacted.

>> Does not remove land availability from commercial/private use in an ever more densely populated South King County. Therefore, is a better long-term stewardship of our finite land.

>> Places OMF immediately next to tracks already under construction. Supports maintenance despite possible realignment and funding issues delaying expansion beyond Federal Way. Earlier start date possible.

>> Creates more south end jobs by not displacing those currently situated on Alternative Federal Way locations.

>> Cost delta between Midway and other projects is dwarfed compared to TDLE, Ballard, Everett, and Kirkland-Issaquah links costs.

Regarding South 344thStreet site:

>> Business (jobs), churches, residences, natural habitat are impacted.

>> Ellenos Yogurt factory has approximately 150 employees, multi-millions of dollars in equipment and special licensing. Is the only industrial business in Federal Way.

>> Garage Town a community of 67 individually owned units (same as owning a condominium unit). Has modern substantial buildings including a clubhouse. They are used as extensions of households and to support businesses. Only facility of its kind in King County.

>> Supports a broadcasting tower. Radio towers have certain land-configuration needs which must be addressed and special licensing.

>> This site is a hill with businesses and residences on all sides. Is not near level like other two sites.

>> Loss of existing family homes.

>> Loss of tax revenue for City of Federal Way and King County.

>> The City of Federal Way has written to Sound Transit of their complete disapproval of any further acquisition of properties in their city. Loss of a portion of downtown retail acreage for rail station is plenty. Another municipality (Kent) would like to accommodate the OMF. Neither of the two Federal Way alternatives should be considered for use.

>> Loss of approximately 250 jobs. (EIS needs to be updated to reflect the true facts on job losses,)

Open your eyes Sound Transit, the best land choice for the OMF is the Midway Landfill area. You are going to have a lot of unhappy voters out there if you choose otherwise.

Patricia Pugnetti

Now, the time is at hand and the EPA's timeline shows that remediation on the Midway site is completed (see above) and the next step is to remove it from the national priorities list just in time to be used for the OMF project.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS. The Midway Landfill is still classified as a high-risk hazardous materials site because it contains contaminated refuse. The remedy for the site includes a cap over the landfill to prevent stormwater from interacting with the refuse and contaminating groundwater below. Please see Final EIS Section 3.13, Hazardous Materials, for more detail.
2	Regarding Midway site: Public preferers using this site. Building at this location is done with consent of the governed. Business (jobs), churches, residences and natural habitat are not impacted. Does not remove land availability from commercial/private use in an ever more densely populated South King County. Therefore, is a better long-term stewardship of our finite land. Places OMF immediately next to tracks already under construction. Supports maintenance despite possible realignment and funding issues delaying expansion beyond Federal Way. Hello Sidney,

Thank you for the thorough response. I believe the Midway Landfill would be the best location for the O&M facility based on this clarification information. The area there with the college, light rail station, new business establishments and additional multiuse 5-story buildings is a terrific foundation of a small land use planned village. The O&M facility is the smart way to deal with the landfill for now and the future. There are very few opportunities to correct a past mistake correctly.

Best regards,
Greg

Dear Board Members,
We have read the EIS for the OMF South and urge you to eliminate the So. 344th site from the list of potential sites. Per your data, and an easy drive around the neighborhood, the So. 344th site is a very valuable addition to the Federal Way community as it contains a large number and variety of affordable housing units and is home to more than 200 jobs. As everyone is aware, after this exceptionally difficult year, housing and jobs are the top priority for any community. And affordable housing in the Puget Sound area is becoming increasingly difficult to obtain. Protecting jobs which add to the community, protecting affordable housing, and maintaining a tax base for the city are all factors which make choosing a different site for the OMF a straightforward choice.
Thank you for considering this input, and, please direct your focus to one of the other two sites. Federal Way and its citizens need this neighborhood intact for housing and jobs.

OMF South DEIS OOH Comment 2

03/05/2021

Environmental impacts, cost, and timeline are most important to me. Since Midway would be so much more expensive and take longer to build, and because building on a landfill has SO MUCH uncertainty (meaning increased cost), I'm inclined to support choosing one of the Federal Way options. Ideally, much of the construction cost savings would be used for substantial environmental mitigation, such as nearby wetland restoration projects and tree planting. However, I'll admit I don't have much information about the residential and business displacement. From an equity standpoint, I'd be curious who would be displaced and if this displacement would be perpetuating any historic harm against low-income communities or communities of color.   Thanks for this informative online open house - I appreciate the use of clear graphics to demonstrate relative quantitative impacts.

1	Since Midway would be so much more expensive and take longer to build, and because building on a landfill has SO MUCH uncertainty (meaning increased cost), I'm inclined to support choosing one of the Federal Way options.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	Ideally, much of the construction cost savings would be used for substantial environmental mitigation, such as nearby wetland restoration projects and tree planting.	As described in Chapter 2 of the 2023 Draft EIS and this Final EIS, Sound Transit's Environmental Policy states that the agency will satisfy all applicable laws and regulations and mitigate environmental impacts consistent with Sound Transit's policies, as well as strive to exceed compliance, restore the environment, avoid environmental degradation, prevent pollution, and conserve resources. The construction cost estimates in Chapter 2 include environmental mitigation costs.
3	From an equity standpoint, I'd be curious who would be displaced and if this displacement would be perpetuating any historic harm against low-income communities or communities of color.	Sound Transit conducted an environmental justice analysis, which is available in Appendix E, Environmental Justice Assessment, of the Final EIS. Table E.5-1 summarizes potential impacts to environmental justice populations and associated mitigation.

OMF South DEIS OOH Comment 3

03/05/2021

The report has a lot of good information. However, I believe the Christian Faith Center site should be removed from the 3 selections. This is a house of worship for many as well as a school. Including the 3rd site that also affects Christian Faith Center areas and surrounding business and residences I don't believe is ideal. The noise at these areas would not benefit the community. While the Kent site offers a better surrounding area, the environmental requirements to prepare this site would be costly. However, considering the neighborhoods for the other 2 sites and the disruptions to those area, I believe the Kent site is still the best option.

Anonymous (Communications ID 472288)

1	However, I believe the Christian Faith Center site should be removed from the 3 selections. This is a house of worship for many as well as a school. Including the 3rd site that also affects Christian Faith Center areas and surrounding business and residences I don't believe is ideal.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	The noise at these areas would not benefit the community.	Sound Transit conducted a noise assessment of the OMF South project alternatives following FTA and Sound Transit policies and practices. Based on the current design, operation of the OMF South site would not have noise impacts. Operation of the mainline track to the Preferred and South 344th Street alternatives could result in noise impacts to some single-family residences, depending on the track design option, which would be fully mitigated. Modification of the existing berm and noise walls adjacent to I-5 would result in traffic noise impacts at about one to three residences in Belmor. Sound Transit would provide traffic noise mitigation measures where traffic noise levels are predicted to be above the 2042 No-Build levels from removal of the existing berm and noise wall. A construction management plan would be developed during the design phase of the project detailing BMPs to minimize potential construction noise impacts on local businesses and residents. See Section 3.9, Noise and Vibration, and Appendix G2, Noise and Vibration Technical Report, of the Final EIS for more detail.
3	While the Kent site offers a better surrounding area, the environmental requirements to prepare this site would be costly. However, considering the neighborhoods for the other 2 sites and the disruptions to those area, I believe the Kent site is still the best option.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.

OMF South DEIS OOH Comment 4

03/05/2021

I firmly believe this is your best available option. Your impact on the community will be substantial in other areas. The landfill makes the most sense even if it costs extra in engineering. It's land that's already vacant and next to I5. Put the tax payers money to good use and don't wipe out churches and established companies. I have spoken to several members of the community and the other sites have streams and wetlands. Local tribal council needs these areas respected. We only get on earth and our environmental impact is very important. What happens when you sell that same land at the landfill 10 years later to developers. The community will feel cheated.

Anonymous (Communications ID 472289)		
Comment ID	**Comment Text**	**Response**
1	I firmly believe this is your best available option. Your impact on the community will be substantial in other areas. The landfill makes the most sense even if it costs extra in engineering. It's land that's already vacant and next to I5. Put the tax payers money to good use and don't wipe out churches and established companies.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	I have spoken to several members of the community and the other sites have streams and wetlands. Local tribal council needs these areas respected.	Regardless of the alternative the Sound Transit Board selects to build, in cooperation with Tribes and permitting agencies, Sound Transit would develop plans to mitigate the effects of the OMF South project on wetlands, streams, and regulatory buffers on a watershed basis as part of the environmental permitting process.

I support the Midway landfill site. Despite higher costs, the impact in the long run on the environment, businesses, residents, and neighborhood in general will be worth the extra cost. The land is currently not being used - don't tear down existing structures/homes and ruin wetlands when we have the opportunity to make something good out of land previous generations wrecked. There is also the issue of equity: if we are considering doing tunnels and such for other portions of the rail system where wealthier people live, we should give lower-income folks (those of us in Kent & Federal Way) the same respect. Because you are not rich doesn't mean you don't care about aesthetics or trashing of natural landscape. We don't want our neighborhoods ruined any more than the home owners in Ballard or West Seattle. It's a matter of equity for people in the South End.

Krista Scott (Communications ID 472294)

2	There is also the issue of equity: if we are considering doing tunnels and such for other portions of the rail system where wealthier people live, we should give lower-income folks (those of us in Kent & Federal Way) the same respect.	The majority of the Link light rail system is above ground, and all operations and maintenance facilities would be above ground. Due to the nature of the maintenance facility, an underground location would be prohibitively expensive to construct and operate.

Mike Juguilon

I propose that the Midway Landfill location will be the home of the OMFS. I know it will be more costly, but to clean up a contaminated waste site and build a facility to benefit the whole of King county is the right thing to do. Additionally, I don't want to us to be displaced. I'm a homeowner at the South 344th Street Alternative. If I knew that this location was on the list of future sites for the OMFS, I won't had purchased it in 2018. Now though, we love our neighborhood of mixed businesses and residences. Please do the right thing. Pick the Midway Landfill site. Let's clean it up then build the OMFS facility. Thank you!

Robert Wheeler

Your information is good; lengthy as it should be and not everyone will spend the time to review it because of that length. Simply put by your own words below MIDWAY is the only choice. This site would create the fewest residential, business and employee displacements of the three site alternatives. It would result in no impacts to community and social resources, wetland or streams and create the fewest forest impacts. Your agency is huge drawing on taxpayers dollars. I reviewed salaries alone from the FOIA obtained in 2018 and it shows 1066 employees. 10 pages into the 43 pages total (253 names) I was still seeing 6 figure salaries. 20 earned over $200,000.00 per year. Do not use "expense for Midway" as an excuse. Do not use "time of construction" as an excuse. Your delivery to date has been late. I pay for it but will never see the "good" if any come from it. I will attend the public meetings and ensure that you hear MIDWAY!

Robert Wheeler (Communications ID 472307)

Maire Dhu Lemley

While I see the Midway Landfill is the longest and most expensive location of the 3 proposed sites, the impact to forests (and animals living there), streams, and businesses at the other sites, is a huge concern. As I live just below the Midway site, next to the College, and use this particular stretch of highway for travel to and from shopping and errands, I am not thrilled about the impact on traffic that a longer preparation time could have. Also, placing columns of concrete seems like there would be noise, and vibration, which after only a small period of time, would become quite annoying. When all is said and done, what will be the noise impact if any, and will shift changes bring in extra traffic and congestion, and if so, will Sound Transit be a partner in road upkeep, and noise and traffic mitigation?

Maire Dhu Lemley (Communications ID 472308)		
Comment ID	**Comment Text**	**Response**
1	While I see the Midway Landfill is the longest and most expensive location of the 3 proposed sites, the impact to forests (and animals living there), streams, and businesses at the other sites, is a huge concern.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	Also, placing columns of concrete seems like there would be noise, and vibration, which after only a small period of time, would become quite annoying. When all is said and done, what will be the noise impact if any, and will shift changes bring in extra traffic and congestion, and if so, will Sound Transit be a partner in road upkeep, and noise and traffic mitigation?	Project construction may result in temporary noise and vibration impacts for all build alternatives. Best Management Practices would be used during construction to minimize potential construction noise impacts on local businesses and residents. Based on the current design, there would be no long-term noise impacts associated with operation of the OMF sites for any of the build alternatives. The South 336th Street and South 344th Street alternatives mainline options could result in noise impacts to some single-family residences along the mainline, depending on the track design option, which would be fully mitigated. Modification of the existing berm and noise walls adjacent to I-5 would result in traffic noise impacts at about one to three residences in Belmor. Sound Transit would provide traffic noise mitigation measures where traffic noise levels are predicted to be above the 2042 No-Build levels from removal of the existing berm and noise wall. Additional information is available in Section 3.9, Noise and Vibration, and Appendix G2, Noise and Vibration Technical Report, of the Final EIS. There would be no long-term traffic impacts associated with operation of the OMF South alternatives. However, there could be increased traffic and congestion during construction. Sound Transit would develop and implement a construction transportation management plan that would address site access, traffic control, and haul routes per city of Kent or city of Federal Way requirements. The plan would include measures to minimize traffic disruptions. Additional information is available in Section 3.2, Transportation, and Appendix G1, Transportation Technical Report, of the Final EIS.

Cheryl Lyons

How much noise would be heard by the train from 320th to 330th St? Would Sound Transit buy property on 330th? How would you keep the homeless population down at the light rail stations and loitering??? This light rail system could make the Federal Way homeless issues worse? How can Sound Transit keep it under control?

Cheryl Lyons (Communications ID 472311)		
Comment ID	**Comment Text**	**Response**
1	How much noise would be heard by the train from 320th to 330th St?	For the South 336th and South 344th Street alternatives, the average equivalent sound levels (Ldn) at the closest residences to the proposed mainline track would range from 55 dBA to 65 dBA, depending on the location. This would not create a noise impact under FTA criteria. More detailed information regarding the noise levels is available in Section 6.3 of Appendix G2, Noise and Vibration Technical Report, of the Final EIS.
2	Would Sound Transit buy property on 330th?	Appendix H1, Potentially Affected Parcels, of the 2023 Draft EIS and this Final EIS lists the parcels that would be potentially partially or fully acquired for the project based on the current design. Sound Transit currently does not anticipate the need to purchase property on S 330th Street. Final determinations of affected properties will be based on the project's final design following the Sound Transit Board's selection of the project to be built.
3	How would you keep the homeless population down at the light rail stations and loitering??? This light rail system could make the Federal Way homeless issues worse? How can Sound Transit keep it under control?	There are no light rail stations associated with the OMF South project.

OMF South DEIS OOH Comment 29

03/10/2021

The OMF is needed for West Seattle or Tacoma extensions. It is not needed for the Federal Way extension. The logical place for a large industrial yard such as this is in an area that is industrial in nature. As this OMF is not needed until much later phases, the options on the table should be tossed and new options reevaluated. The most appropriate place for this yard is likely in the industrial area of the Tacoma / Fife tideflats. I would also look at this with the lens of Equity. The areas that are being selected currently are home to our low income and BIPOC populations. Why are we placing massive industrial infrastructure with 24x7 light and noise pollution where our poor and BIPOC neighbors live?

Anonymous (Communications ID 472312)		
Comment ID	**Comment Text**	**Response**
1	The OMF is needed for West Seattle or Tacoma extensions. It is not needed for the Federal Way extension.	FWLE could operate without the OMF South. However, once built, OMF South would serve the entire Link system. The Link System-Wide Storage Building would receive and store all parts of the Link light rail system, including LRV parts and components, MOW track and components, and facility parts and components.
2	As this OMF is not needed until much later phases, the options on the table should be tossed and new options reevaluated. The most appropriate place for this yard is likely in the industrial area of the Tacoma / Fife tideflats.	Three sites in the Tacoma tideflats area were evaluated as part of the alternative development process. More information can be found in the OMF South Alternatives Evaluation Technical Memorandum (https://www.soundtransit.org/sites/default/files/documents/operations-and-maintenance-facility-south-alternatives-evaluation-technical-memorandum.pdf). The sites were not carried forward because their southern location would affect the ability to open the facility in time to accept and commission the new LRVs needed to implement Sound Transit 3. Sound Transit has adopted a realignment plan that serves as a framework for delivering agency system expansion as rapidly as possible. While changes have been made to the implementation schedule of Sound Transit 3, an OMF in the southern portion of the Link light rail service area is needed by 2030. The current forecasted in-service date is 2032 for the Preferred and South 344th Street alternatives and 2035 to 2037 (depending on the subsurface construction design option) for the Midway Landfill Alternative. Sound Transit is pursuing measures to advance the opening earlier.
3	I would also look at this with the lens of Equity. The areas that are being selected currently are home to our low income and BIPOC populations. Why are we placing massive industrial infrastructure with 24x7 light and noise pollution where our poor and BIPOC neighbors live?	Appendix E, Environmental Justice Assessment, of the Final EIS evaluates potential impacts to environmental justice populations.

OMF South DEIS OOH Comment 32

03/11/2021

The Midway landfill alternative while more costly upfront and more challenging due to the superfund site status seems to be the best long term decision. It puts a piece of property to a better use than simply being a capped landfill while it offers fewer impacts to residents in the Federal Way area that would be displaced by either of those options, allows business and tax base to remain rather than be lost in Federal Way, and does not impact the streams in the Federal Way area.

Anonymous (Communications ID 472320)

OMF South DEIS OOH Comment 31

03/11/2021

Danyel Lyons

The Midway Landfill is the best option. There are only two negatives for location that will require detailed planning and impact considerations: 1. Superfund site and all of the environmental mitigations that come with it. 2. Traffic and pedestrian impacts. Being next to 516 & I-5 interchange and a college already causes problems with large volumes. Adding the transit stop and OMF will cause an exponential volume increase and will require a major overhaul the traffic pattern/plan for a mile in all directions.

Danyel Lyons (Communications ID 472321)

1	The Midway Landfill is the best option. There are only two negatives for location that will require detailed planning and impact considerations: 1. Superfund site and all of the environmental mitigations that come with it.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	2. Traffic and pedestrian impacts. Being next to 516 & I-5 interchange and a college already causes problems with large volumes. Adding the transit stop and OMF will cause an exponential volume increase and will require a major overhaul the traffic pattern/plan for a mile in all directions.	The traffic operations analysis for the Midway Landfill Alternative incorporated existing and forecast background traffic as well as planned transportation improvements from other projects. The transportation analysis was updated in the 2023 Draft EIS and again for this Final EIS and concludes that the Midway Landfill Alternative study intersections would continue to meet level of service standards with the project.

Jason Little

I prefer the Midway site with the excavation plan. It has by far the fewest residential, business and environmental impacts which minimizes potential cost and litigation due to land acquisition, community impact and natural environment mitigation strategies. It also doesn't require the build of additional track beyond Federal Way at this time saving project cost in the near term.

Lydia Long

Please consider the negative impact to our community if you build the maintenance facility in Federal Way. The initial investment to clean up and re-purpose the Midway Landfill location is well worth the time and money. It will take useless land and recycle it into a valuable asset. Also, the Midway Landfill location with not negatively affect any residential areas. Thank you.

Lydia Long (Communications ID 472325)		
Comment ID	**Comment Text**	**Response**
1	Please consider the negative impact to our community if you build the maintenance facility in Federal Way.	The purpose of the environmental review process is to identify significant adverse environmental impacts and propose mitigation measures to reduce the impacts.
2	The initial investment to clean up and re-purpose the Midway Landfill location is well worth the time and money.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.

After looking at all three choices and evaluating the potential impacts to the ecosystem, businesses, the residence, the community as well as the costs, and current land utilization. The midway landfill is the best choice. Yes, it will cost more but we will be repurposing the landfill in a positive manner and turning something that has been an eye sore into an integral part of our community. While minimizing all of the impacts above else where. The investment is worth the additional cost.

Kyle Kooy

Midway landfill is the best geographical location: already empty land that requires no buyout, already on the mainline that is getting built right now, and in a worst case scenario where the Tacoma extension has to be put on indefinite pause due to Covid-related funding impacts, it requires no extra mainline to be built beyond the Federal Way extension. However, the impact of it being a landfill, and all the problems that come with building on a superfund site, are even more enormous than I imagined. From a pure budgetary standpoint, either of the other two sites should be used, simply because Covid has caused ST3 funding to evaporate to such a degree that resource are spread too thin to do anything but the cheapest option. Unfortunately for the accountants, I am an idealist. With Sound Transit being a public organization rather than a private one, I think it should have the duty to look beyond the monetary cost/benefit analysis of a project and instead focus on how much of an improvement said project can bring to an area. Of the three sites, I think developing the Midway site provides the greatest improvement to the surrounding community. Yes, it will cost billions of dollars more, but it will reduce (or possibly even eliminate, if I understand the full excavation proposal correctly) the impact of a superfund site that is smack dab in the middle of a growing urban area, directly adjacent to three major transportation arterials (99, I-5, and eventually the Link Mainline). Kent and Des Moines were quite eager to push the landfill onto Sound Transit when the initial OMF rumor pointed to a shopping center, and perhaps those cities can put some money where their mouth is and assist with the cost, along with Seattle who would no longer be responsible for monitoring and cleanup. This literal neighborhood cleanup could be a group effort to do good. The other two sites involve eminent domain of land that can be used for other purposes, and in fact currently is. Using Midway offers the region the opportunity to transform useless, dangerous land into something useful. I think that is a long term benefit to the area that is worth the added cost, and it's only with Sound Transit's governmental backing and large funding that I foresee this site ever being transformed to something usable in my lifetime.

Laura Arnold

Although the projected cost and length of time are higher for the Midway facility, I believe this would be the best choice. The other two displace workers and residents. There is a high number under represented residents and employees in this area and that needs to be acknowledged and considered strongly. What will happen to those displaced? Is there trully fair compensation that all of the residents and employees have a say in? Or is there any compensation? And that is a cost factor. Then there are the protected lands that could really screw up the ecosystem. Not just what is built upon but also the other side of I-5. Yes. There is noise but then you are increasing noise and air pollution. There has already been a large growth of urban development in Federal Way, so I hear from long term residents. I would hate for Federal Way to loose more of it's natural beauty as well. Then the construction and constant ongoing work at the Federal Way sites 336th & 344th would continue to disrupt the ecosystem around the facility, not to mention disrupt traffic and make it harder for travelers and commuters getting to and from Auburn. Also, why does the midway location cost more annually? I understand construction but not the ongoing cost. There is less track to the facility. Because it is further from the FW transit center? It would be closer to the Kent stations wouldn't it? Even so, I would rather have the extra cost to protect the community and the environment. Also, it seems excavation would be a safer option but I am not an engineer. But I do worry about employees working over a toxic ground. I would think with heat and other environmental changes the toxins could rise to the surface. Plus, wouldn't that be better if there is still shifting ground? Again I am not an engineer.

Laura Arnold (Communications ID 472331)		
Comment ID	**Comment Text**	**Response**
1	Although the projected cost and length of time are higher for the Midway facility, I believe this would be the best choice.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	There is a high number under represented residents and employees in this area and that needs to be acknowledged and considered strongly. What will happen to those displaced? Is there truly fair compensation that all of the residents and employees have a say in? Or is there any compensation? And that is a cost factor.	Appendix E, Environmental Justice Assessment, evaluates potential impacts to low-income and minority populations. As described in Appendix E and Section 3.3.4, Sound Transit Acquisition and Relocation Policy Summary, of the 2023 Draft EIS and this Final EIS, Sound Transit would compensate all affected property owners according to the Sound Transit Real Property Acquisitions and Relocation Policy, Procedures, and Guidelines and in accordance with state relocation and property acquisitions laws. Acquisition and relocation costs were included in the conceptual capital cost estimates described in the 2021 Draft EIS as shown in Table 2.6-1 in Section 2.6, Funding and Conceptual Cost Estimates and have been updated in Table 2.5-1, Opinion of Probable Cost for Preliminary Engineering Design of the Build Alternatives in the Final EIS. Employees of displaced businesses would not be directly compensated. If the displaced business relocated in the area, the employee could follow. If the business owner decides to relocate elsewhere or close their business, the employee would become unemployed.
3	Also, why does the midway location cost more annually? I understand construction but not the ongoing cost. There is less track to the facility. Because it is further from the FW transit center? It would be closer to the Kent stations wouldn't it?	The additional $1M in annual operations and maintenance cost for the Midway Landfill is discussed in the Executive Summary and Section 2.5, Funding and Opinion of Probable Cost, in the Final EIS. The higher cost is attributed to additional annual expenses to mitigate for potential risks posed by settlement and methane gas over the lifespan of the facility. It is also due to higher operating costs for the trains to deploy each morning before passenger service begins and return to the OMF each night after passenger service has shut down.

Laura Arnold (Communications ID 472331)		
Comment ID	**Comment Text**	**Response**
4	Also, it seems excavation would be a safer option but I am not an engineer. But I do worry about employees working over a toxic ground. I would think with heat and other environmental changes the toxins could rise to the surface. Plus, wouldn't that be better if there is still shifting ground?	If excavation of landfill materials is required, safety precautions including personal protective equipment, air monitoring, and other best practices would be employed to ensure the safety of workers on site. With excavation, landfill contaminants would be removed from the site and disposed of in a controlled manner limiting movement outside the landfill. The design of a platform over the landfill would use stabilization methods to prevent landfill settling. See Section 3.13, Hazardous Materials, in the Final EIS for additional information. An Environmental Protection Plan would likely be required to establish procedures to manage and monitor the waste excavation and handling process, including management of stormwater and landfill gas. In addition to continuous landfill gas management, measures would need to be established to prevent air intrusion into the landfill that could result in a landfill fire. A project-specific Health and Safety Plan would also be required and would include stipulations that construction workers who may be exposed to potentially hazardous substances would be required to obtain the appropriate level of Hazardous Waste Operations and Emergency Response Standard (HAZWOPER) training.

Barbara Sperling

I strongly oppose either of the two sites located in Federal Way. Bringing such a site to the downtown area would destroy it. Who would want to come anymore. I certainly would not. It would uproot business, cost jobs and destroy homes. The level of traffic, during and after construction, caused by the site would have a horrible effect on traffic in the area. Property values nearby would plummet. It is past time that we stop putting money before people. The Midway Landfill may be more expensive financially, but it would destroy fewer lives and businesses and would leave Federal Way as city still worth living in. Putting this site in Federal Way would only drive people and businesses away.

Christopher Ensor

I prefer the Midway option to both the Federal Way EIS options.   Although Midway will be more expensive and will cause more disruption during construction, it has less environmental impact and will not require the removal and replacement of any existing commercial and residential property. I believe these are the most important longer term issues. Please pick Midway! This is land that is not required for any alternative use and will otherwise not contribute to any environmental or economic solutions. Yes, more expensive, but please think longer term. The draft EIS shows this is the best choice.

Christopher Ensor (Communications ID 472337)

Ruth Strawser

Having read the Draft EIS for the Sound Transit OMF South project I respectfully submit my preferred alternative recommendation is the South 336th Street Alternative. My recommendation is based on total cost of the project and the construction duration both of which appear lowest in this alternative. In my view the Midway Landfill site alternative should be removed from any further consideration. The higher cost and construction make it unattractive as a taxpayer. The site leaves open too many open questions related to cost and design which will obviously equate to a higher overall project cost. I believe the remediation costs alone would seriously delay, or worse cancel, the project for too long a time period. And the liability for the site is just too high a risk. I understand the concerns expressed by the city of Federal Way related to the South 336th Street and the South 344th Street Alternatives, but in my view those can be more easily mitigated than what the Midway Landfill site might expose in terms of costs and mitigation. So finally I submit the South 336th Street Alternative should be the alternative selected for the Final EIS for the South OMF project. Thank you for allowing my recommendation to be submitted.

Ruth Strawser (Communications ID 472340)

OPERATIONS & MAINTENANCE FACILITY SOUTH DRAFT EIS

ONLINE PUBLIC MEETING & HEARING

March 24, 2021

REPORTED BY: Thad Byrd, CCR
REPORTED ON: 3/24/21

WEDNESDAY, MARCH 24, 2021

6:45 p.m.

-- oo 0 oo --

GREG: Hello, my name is Greg, and my question is on noise mitigation and how much contribution we believe the light rail yard will contribute to the environment where we have multiple trains and sharp tracks as the train's coming in and out.

Do the wheels squeal? Are they unloading or disconnecting heavy equipment? I don't know. I worked in a facility down by Martin Luther King Way, the south end of Boeing Field.

There's kind of an S curve that the lightrail goes through. The train actually squeals. I know that Sound Transit works on it quite often trying to mitigate the noise, but I was wondering if that single train is similar to what we have.

It looks like about six tracks or a dozen tracks in the yard. What has the noise mitigation been or expectation?

I did print the draft and looked through it, and it looks like a very thorough job from what I can see. Both of them are good.

I guess my personal opinion would be the Midway Landfill would be the more logical site because it's been a problem, eyesore, what to do with the past landfill, what to do with it.

A plan of this scale would probably solve that, but the biggest concern I have is that there's a community college up there and a lightrail station.

In the future there's going to be a village area, and it'll probably be apartment housing. It's a good place for the city to develop around.

This might be the right thing, but if you have something that's going to create a lot of noise contributing to the school and everything else where people live there, maybe it's not a good idea.

LIZ MACK: Thank you, Greg. We'll move on to our next speaker, which is going to be Timothy.

TIMOTHY: Hello, I'm Tim, and I want to put in my vote for the Midway Landfill lot off of what was said previously here.

I think it is a place that is going to have the least effect on people because if we use the other two sites that are in Federal Way, there's going to be an effect on housing and there's going to be an effect on businesses.

Of course, housing is a huge issue, and for us to take away either one of the sites is going to remove a bunch of residential housing. We're going to be removing some businesses, especially in the 344th site. The least amount of personal effect or human effect is going to be with the Midway Landfill.

I understand the engineering issues with it. When it comes from an engineering standpoint, using either one, any one of the three different resolutions for the Midway Landfill, none of them sound really wonderful.

I get it, but we're not going to have also an environmental effect that hasn't already been done decades ago.

We're not going to have to deal with either of the streams like we're dealing with in the 344th or 336th Street site, and so this is why I'm voting for the Midway Landfill because of the least amount of personal and also environmental effects. Thank you.

MS. MACK: Thank you for your comment.

SUZANNE VARGO: This is Suzanne, and thank you so much. Having fought for the warehouser campus for the last five years, having been on it since I was six years old, having lived in this city for the last 55 years, have you guys taken into consideration your 75 truck trips plus the additional roughly 800 that the IRG businesses' warehouses will also be impacting on our area?

320th, Highway 18 are both at maximum failure and have been for many, many years. We don't seem to be getting any relief there, and I'm concerned that we in the south end are just not going to be able to function.

We are not going to be able to manipulate our city. Our traffic manager tells us the next 10 years in the City of Federal Way will be an absolute nightmare as he drops his head and shakes it.

I'm a little nervous, and he was just talking about our 320th with the Sound Transit facility going in over there, so I'm very concerned as a resident over here in the south end.

How we are going to function unless you have taken into consideration the other developments' plans in this area and the limited road availability that we have at this point?

We don't seem to have many places to go, so that's just one of my questions. I'll be talking to Paul I'm sure in the future about all sorts of great environmental stuff, so thank you so much you guys.

I really appreciate this, and I think this is a nice way to get things done, so thank you very much. May I just say go Midway Landfill?

LIZ MACK? Thank you.

MARGARET SIMMONS: Hi, there. It's Margaret. The name Mott MacDonald is the name of the company that I work for, so it just signed me in that way, so apologies for that.

I am a resident of Federal Way and actually an engineer, so I follow all this stuff and appreciate the opportunity here to make a few statements.

Contrary to the prior speakers, I do not support the use of the Midway Landfill. I have some knowledge about what the problems are that are being experienced by the Federal Way construction link extension construction right now, and the expense it's causing.

I believe that Sound Transit should not own the fact that the Midway Landfill is contaminated and the extra cost of hundreds of millions of dollars to mitigate the contamination that is at that site.

There are many projects that are vying for a limited amount of money at this point. We've talked about the realignment.

There's many other communities who need similar lightrail extensions without any sort of contributions from the City of Seattle, who owns that site or others who have responsibility for that site. I don't think we should be selecting that site. I think there are two other sites that are equally viable.

I do understand the motivation behind getting that site covered and into a more useful condition, but not to the expense of other projects and maybe even the significant delay in this project with the additional costs and the time that it would take to earn the revenue to be able to address it, so thank you.

LIZ MACK: Thank you for your comment. Our next speaker is going to be Susan Honda.

SUSAN HONDA: I just wanted to thank you for the opportunity to let people speak with you tonight. I wish this was in person, but it is what it is.

I also wanted to be on record that the city council voted to support the OMF South at the Midway Landfill. The city council has sent two letters to the Sound Transit board in support of that decision.

Members of the council have gone to board meetings to speak with Sound Transit in person when that was possible.

If this was to be built in Federal Way, we would lose housing. We would lose childcare, and we all know that with the pandemic, childcare has become a very real issue in which women, especially women have not been able to go to work because of lack of childcare.

We would lose businesses, and we have two businesses that we know may not be able to be replaced because it would be too difficult to find something that would be suitable for them to be rebuilt.

It would take away some money from our taxes here in Federal Way which support many, many things, and once again as a private citizen, I do support the Midway Landfill. I think it is the best site, and truly the only site that this should even be considered. Thank you very much.

LIZ MACK: Thank you for your comment. Our next speaker is Vic.

VIC: Thank you just for the opportunity here. I want to also share my opinion. I think that the Midway would make the most sense. I do appreciate some of the comments that it is a landfill. It would probably cost a lot to fix and to mediate.

At the same time that will have to be dealt with either way in the future, and I think that if you have a suitable site for such an operation as this, it would be great to take advantage of that to mediate at this time and to make things work.

I think it's also harder for the residents in the Federal Way site to have to deal with all these changes because now we are impacting homeowners and families who have to move out.

I personally have family there who are already retired, and it's very, very hard for them to be able to deal with this.

In addition, it is much easier I think to have the overall area pitch in in terms of taxes and any kind of costs that may be incurred versus having to impact and have all of this pressure weighed upon the shoulders of just a few families and a few businesses in that smaller area there. I thank you for the opportunity to share my opinion.

LIZ MACK: It looks like our next speaker will be Bill.

BILL: First time to use this Zoom system, so bear with me. Regarding the Midway Landfill, I'm also for that. My whole family's for that.

When I look at the projects that Sound Transit has in work, the extension to West Seattle, Issaquah and these other sites or locations, the costs on your documentation are way more than the Midway Landfill.

If the Midway Landfill does end up costing more than the Federal Way sites, you need to put it in perspective, but it's far below what you're spending on other projects.

You need to step back, look at big pictures. It's not like it's just ominous over all the other constructions.

By building at Midway Landfill, you add jobs to the south end, and you do not take the jobs away from the location in Federal Way. One of your features is, yes, we bring in jobs, but going to Federal Way, yes, you delete jobs.

You replace some of those with your facility, so overall benefit to the south end to add a large increase in jobs instead of subtracting some to add yours. Thank you.

1	Hello, my name is Greg, and my question is on noise mitigation and how much contribution we believe the light rail yard will contribute to the environment where we have multiple trains and sharp tracks as the train's coming in and out. Do the wheels squeal? Are they unloading or disconnecting heavy equipment? I don't know. I worked in a facility down by Martin Luther King Way, the south end of Boeing Field. There's kind of an S curve that the lightrail goes through. The train actually squeals. I know that Sound Transit works on it quite often trying to mitigate the noise, but I was wondering if that single train is similar to what we have. It looks like about six tracks or a dozen tracks in the yard. What has the noise mitigation been or expectation?	An updated discussion of potential noise and vibration impacts from OMF South are discussed in Section 3.9, Noise and Vibration, and Appendix G2, Noise and Vibration Technical Report, in the Final EIS. The noise assessment evaluates the change in noise due to the project and is based on the existing noise levels in the environment before the project is introduced. It considers all noise sources within the OMF site, including train movements, vehicle washing, and vehicles entering/exiting from the mainline tracks. Sound Transit has committed to reducing any potential wheel squeal by installing wayside lubricators on tight radius curves for both the mainline track and within the OMF sites for all three build alternatives. Wheel squeal is discussed in more detail in Section 6.2 of Appendix G2, Noise and Vibration Technical Report. Noise mitigation is also discussed in Section 3.9.3 of the Final EIS and Section 8 of Appendix G2, Noise and Vibration Technical Report. No noise impacts were identified for operations within any of the three OMF South alternative sites. However, mitigation is recommended for LRV operation along the mainline track and for traffic noise as a result of modifications to the noise walls and berm adjacent to I-5.
2	I guess my personal opinion would be the Midway Landfill would be the more logical site because it's been a problem, eyesore, what to do with the past landfill, what to do with it.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.

Tim (Communications ID 472437)		
Comment ID	**Comment Text**	**Response**
1	I think it is a place that is going to have the least effect on people because if we use the other two sites that are in Federal Way, there's going to be an effect on housing and there's going to be an effect on businesses. Of course, housing is a huge issue, and for us to take away either one of the sites is going to remove a bunch of residential housing. We're going to be removing some businesses, especially in the 344th site.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS. Section 3.3, Acquisitions, Displacements, and Relocations, of the 2023 Draft EIS and this Final EIS provides updated information on potential displacements. Section 3.3.4, Sound Transit Acquisition and Relocation Policy Summary, provides information on how Sound Transit would compensate all affected property owners according to the Sound Transit Real Property Acquisitions and Relocation Policy, Procedures, and Guidelines and in accordance with state relocation and property acquisitions laws.
2	The least amount of personal effect or human effect is going to be with the Midway Landfill. I understand the engineering issues with it. When it comes from an engineering standpoint, using either one, any one of the three different resolutions for the Midway Landfill, none of them sound really wonderful.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.

Suzanne Vargo (Communications ID 472438)		
Comment ID	**Comment Text**	**Response**
1	Have you guys taken into consideration your 75 truck trips plus the additional roughly 800 that the IRG businesses' warehouses will also be impacting on our area? 320th, Highway 18 are both at maximum failure and have been for many, many years. We don't seem to be getting any relief there, and I'm concerned that we in the south end are just not going to be able to function.	The transportation analysis for OMF South does not use forecasts from specific businesses or developments. Rather, it estimates future traffic growth using a travel demand model that takes into account locally adopted land use plans throughout the region. The analysis applied the growth percentage and rerouted traffic based on roadway network changes necessary to access the proposed OMF South alternatives. Please see Final EIS Appendix G1, Transportation Technical Report, for more detail.
2	How we are going to function unless you have taken into consideration the other developments' plans in this area and the limited road availability that we have at this point?	Chapter 4 of the EIS considers the cumulative effects of OMF South with other proposed projects in the area. The list of other proposed projects was updated for the 2023 Draft EIS, which is reflected in this Final EIS. OMF South is not anticipated to result in cumulative impacts to traffic as described in Section 3.1, Transportation, of the Final EIS.
3	May I just say go Midway Landfill?	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.

Sound Transit is a regional agency funded partially by property taxes and car tab fees paid by property and vehicle owners in King, Pierce, and Snohomish counties.

Bill (Communications ID 472443)		
Comment ID	**Comment Text**	**Response**
1	Regarding the Midway Landfill, I'm also for that.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	When I look at the projects that Sound Transit has in work, the extension to West Seattle, Issaquah and these other sites or locations, the costs on your documentation are way more than the Midway Landfill. If the Midway Landfill does end up costing more than the Federal Way sites, you need to put it in perspective, but it's far below what you're spending on other projects.	The Link light rail extensions identified in the Sound Transit 3 Plan, including the extension to West Seattle and the extension from South Kirkland to Issaquah, include different project scope elements resulting in higher costs. For example, the extension from South Kirkland to Issaquah includes about 11.8 miles of mainline guideway and four stations. Due to this, the light rail extensions are anticipated to have higher costs than the OMF South alternatives.
3	By building at Midway Landfill, you add jobs to the south end, and you do not take the jobs away from the location in Federal Way. One of your features is, yes, we bring in jobs, but going to Federal Way, yes, you delete jobs. You replace some of those with your facility, so overall benefit to the south end to add a large increase in jobs instead of subtracting some to add yours.	Section 3.5, Economics, of the 2023 Draft EIS and this Final EIS identifies estimated business and employee displacements for each of the alternatives. Some displaced businesses may choose to relocate in the same area, while others may not. Since the relocation decisions are determined by individual business owners, the EIS does not calculate a net job gain/loss.

OPERATIONS & MAINTENANCE FACILITY SOUTH DRAFT EIS

ONLINE PUBLIC MEETING & HEARING

March 30, 2021

REPORTED BY: Thad Byrd, CCR
REPORTED ON: 3/30/21

THURSDAY, MARCH 30, 2021

12:12 p.m.

-- oo 0 oo --

LIZ MACK: Our first speaker is Arnie.

ARNIE: One of the things I'm rather concerned about is the people that are affected by the EIS, especially the 346th area estimates do not seem to be a good way to share in how many jobs will be affected.

They grossly undercount some of the parcels that are there. They put a little asterisk by it and say 11, but that area has branched down.

There's 67 separate parcels in that property, and they're owned by different people and to lump them into one is really unconscionable.

The other thing I would say as far as the jobs, it says 470 new jobs. It really doesn't count all the jobs that are being lost, and that's why it's important to get an actual count done.

If they could include how many jobs are being lost, that benefits greatly the decrease for the number of jobs, and the tax base that is lost choosing either 336th or 348th is significant to the City of Federal Way.

I would just strongly encourage people, despite the problems, to use the Federal Way landfill for the OMF South.

LIZ MACK: Thank you for your comment, Arnie.

JEANNE BURBIDGE: I appreciate the opportunity to make a couple of comments. I noticed the concern about the additional cost for the Midway Landfill site.

However, there should be additional resources available because of the fact this is a Superfund site. There is something called Brownfield money that may be called something else now, but in the past has been used to address similar kinds of conditions of property that is virtually unusable for any purpose without improvements and dealing with the damage that has been done to that property through the landfill.

I believe that using the Midway Landfill site would actually have a double benefit in providing a very good location in terms of its accessibility and its lack of causing business displacement or social displacement or other kinds of environmental concerns and problems, whereas both of the Federal Way locations have been found to result in social concerns and displacements, residential displacements, business displacements, employee reductions and environmental concerns in terms of the wetlands in terms of the forest and in terms of the streams with the network that's very present throughout that area, so indeed my strong recommendation would be the Midway Landfill site. Thank you.

LIZ MACK: Thank you for your comments.

T. NEWBERRY: Thanks for this opportunity. I would just like to kind of say I think the Midway Landfill site probably does have a few things going for it without disrupting other folks and businesses. That's first and foremost.

I also wanted to comment or ask a question as to whether or not a waste conversion facility may have been thought about for this site, which may help clean up the site, create some economic opportunities possibly for Sound Transit, there being some definite benefits to the Kent and Federal Way areas and have the opportunity to create real sustainability, so I'm just wondering if that had been considered at all.

LIZ MACK: Great, thank you very much for your comment.

Members of the Sound Transit Board,

I have read the Draft EIS Statement for your OMF South facility. Based on your research, selecting the S 344th Street site would eliminate over 248 jobs from the community, evict 3 churches, level more than 67 affordable homes, and erase 12 small businesses and the last industrial blue-collar jobs in Federal Way. Our community cannot afford to lose this neighborhood.

Please consider the other sites instead of this one. This is an easy choice, backed up by your data, that I expect you to make to benefit our community.

I believe the Midway Landfill would be the most appropriate site for a train yard. The site is already being used to build the infrastructure for the trains. It makes sense to continue to build up that site for the train yard and to not displace established neighborhoods, communities, homes and businesses.

Thank you.

Cynthia Phillips

We have lived within 3 to 4 miles of site 10A for over 45 years in our home. I have made many friends that live within that site 10A and have visited some of the businesses too. There are a lot of people that have lived there for most of there lives and are elderly. These elderly people have no where else to go at this time in their lives and can not afford to move and start all over. There are also a lot of low income people that can't just pick up and move. All these people have found stability that they have never had before. It isn't right to take that away. There are also 3 churches within site 10A.

It is the only industrial site in Federal Way. You say you are going to add lots of jobs but you are taking jobs away from people that have been working at these companies earning job security and seniority and may not be hired some where else.

Elleno's has put millions of dollars into its facility to make the world's best yogurt factory. Other businesses have worked hard running their businesses to offer what this area needs. Please don't take the homes away from my friends. Also please don't make our business owners and employees lose their jobs so they can't support their families.
Please do not consider site10A & choose one of the other 2 sites.

Thank you
Cindy Broyles

Subject: Public comment on Light Rail South Maintenance Facility - Midway Landfill

CAUTION: This email originated from a contact outside Sound Transit. Remember, do not click any links or open any attachments unless you recognize the sender and know the content is safe. Report any suspicious email by clicking the “fish” button in Outlook. Thank you! ST Information Security

I am a resident of Federal Way and greatly concerned about the two alternatives for the LR South Operations and Maintenance Facility proposed for Federal Way. Both options will negatively impact the fragile Hylebos Creek and wetlands ecosystem. Negative environmental impacts affect the local acreage and all the way down the watershed to where it drains directly into the Puget Sound. Both Federal Way locations also displace numerous residential, business and worship centers. The Christian Life Center is a large facility and would be difficult to relocate.

The Midway Landfill alternative is the best choice because it is already publicly owned and mostly vacant. As a Superfund site, I know it will be more expensive and take longer to prepare the site, but it is an excellent use of such property. Additionally, no mainline track needs to be built or maintained.

Federal Way is looking forward to having Light Rail coming to our city, but we do not want the negative environmental and social costs that are proposed.

Please choose the Midway Landfill alternative for the South Operations and Maintenance facility.

Thank you,
Sheryl DeTray

OMF South DEIS OOH Comment 61

04/09/2021

Becky Tougher

The 336th street site should be the selected site. The Midway Landfill site has the highest cost, highest probability of significant cost overruns due to unknowns regarding the landfill and the longest construction time. The 344th site displaces more businesses and employees along with more residential displacements. The impact to streams and wetlands is similar for the 336th and 344th sites. The 336th site has less of an impact on businesses and residents than the other options for approximately the same amount of money as the 344th site are the reasons for choosing the 336th site as the preferred site.

Becky Tougher (Communications ID 472735)

Arthur McIrvin

It appears that the midway site will have the least amount of disruption on peoples dwellings, businesses, the environment (Hylebos drainage system), and traffic flow in the city of Federal Way which also increases the carbon emissions. This is where I believe it should be built.

Bruce Honda

The human impact of placing the OMF in Federal Way will be devestating beyond any differences in cost to mitigate use of the Midway landfill site. As an engineer I seriously question the cost estimates as well as the potential to get federal super site funding. It could actually cost our taxpayers less in the long run. I would strongly recommend discussions with our Congressional delegation and even President Biden to include the Midway site in the Infrastructure Bill. Thank you

Bruce Honda (Communications ID 472738)

Susan Johnson

I believe that the Midway site is the best alternative, despite additional costs and time to construct. This landfill site is contaminated and a blight to S. King Co. The construction of an OMF site would bring the property up to its highest and best use without impacting the lives of King Co residents. Perhaps additional federal money could be accessed for this site.

Susan Johnson (Communications ID 472739)

AnnMichelle Hart

I propose taking the Church property. I will explain my thoughts and how I got to that decision: Of the three sites I favor the Landfill site but I'm concerned about the vast cost differential this site will require. San Diego has a runway on landfill so we know it can be done. I'm not sure post-pandemic our region can afford the extra cost. The industrial business loss to the City of Federal Way would be a huge impact - far beyond the dollars quoted. Those jobs will be lost, a number of the families probably would leave the city for jobs elsewhere. I'm not willing to take that chance. We need all the home-grown businesses we have. We are trying to end our legacy of being a just a bedroom community for other bigger cities like Seattle and Tacoma. That leaves the Church property. Christian Faith Center has moved a number of times in its existence. It can move again without harm to the church community. They will be compensated for the infrastructure and they are free to reinvest in other property. The true "church" is its people, its community of believers, not the building. Please, I urge you to take the Church property so as to do the least harm to our City.

Sound Transit is currently considering potential alternatives for the location of the new South Operations and Maintenance Facility (OMF). The focus seems to be narrowing on two of them: South 336th Street and South 344th Street. This, to me, appears a willful disregard to local area communities when a much more logical alternative exists: use of the Kent Midway Landfill site.

The 336th & 344th Street alternatives are detrimental to the local community with regard to housing and business displacement. The resulting disruption serves to negate much of the positive impact the OMF would have on providing more jobs to the area. Additionally, an OMF in the 336th or 344th Street sites would have a detrimental impact on Hylebos Creek. Building the OMF on the Midway Landfill site would eliminate displacement of residents and businesses further enhancing the OMF's benefits to local communities. Use of the landfill site returns a formerly polluted location to productive use instead of doing environmental harm to another area.

The Kent Midway Landfill Superfund Site has been deemed "Site Ready for Reuse and Redevelopment" since 2007. One of the goals of Superfund Cleanup is to return a site to productive use. What better use for this particular site? The eastern perimeter of the site is already being developed for the widening of I-5 and the Federal Way Link Light Rail Extension Project. To use the site to further support our region's transportation infrastructure by choosing it as the South OMF site is a logical next step.

Developing the Midway Landfill Superfund site will be more expensive in the short term, but the long term benefits brought about by added OMF jobs without disruption to local communities and their ecosystems is more than worth that cost.

Investing in the South OMF at the Kent Midway Landfill site now is not only the right thing to do, it is a social, economic and ecological imperative.

April 09, 2021

Dear Sound Transit,

Please consider using the Midway Landfill for your maintenance base. Reclaiming the land would benefit our entire area and show that you are indeed interested in the environment. The other two locations suggested would have a tragic impact on our little community and could possibly cause damage to the Hylebos Wetlands we have ferociously protected and cared for while developing the Federal Way community.

Please think of our children, our community, and our future. Choose the Midway Landfill.

Thank you,
Sandy Shinbo

Why is GarageTown on site 10A listed as one property when we have 57 owners that pay taxes on 67 garages? It seems very unfair with the numbers on the Draft EIS process. These garages are an extension to our homes. There are businesses operating within Garage Town also.

Best Regards, Kenneth Broyles

To whom it may concern:

The Sound Transit railyard belongs at the Kent Midway Landfill.

A mature Superfund landfill next to a busy freeway & major arterial (Pacific Highway South) will have no better opportunity for it to be repurposed in the foreseeable future.

Too contaminated for housing. Too close to the freeway for ball fields. Too small for a golf course (and too noisy). And course the poorly designed cap – shaped to save the PRPs money while limiting future use (which they have no interest in).

Putting the railyard at another location would repeat the eco-imperialism that brought forth this Superfund site to begin with – another example of Seattle (then city of Seattle, now Sound Transit) trying to export their problems to other cities will retaining the benefits for themselves.

The additional costs beyond what Sound Transit wants to pay should be the responsibility of the PRP (city of Seattle), the EPA, the Washington State Department of Ecology and the Washington State Department of Transportation who during the Superfund process helped create an unmanageable landfill cap to begin with.

Thanks,

Ted Etheridge

The Draft EIS does not correctly count the number of property owners and businesses that would be impacted by building the OMFS on the South 344th site.

The Garage Town facility at 2010 S 344th Street is a condominium consisting of 67 individually-owned tax parcels. The Draft EIS does not classify Garage Town owners as commercial owners or residential owners and these individuals are not included in the count of property owners or parcels (even though occupants of a 4 plex were so counted). See Table ES-1 on page ES-17 of the Executive Summary. The table only shows 20 Residential and 11 Business Displacements for the entire South 344th Street Site. Garage Town alone has 67 separate individual Condominium parcels and owners. Also see Table 3.5-5 in the Draft EIS.

This inaccurate count distorts the true number of individuals impacted in the data for the South 344th Street site contained in the Executive Summary. These inaccuracies must be corrected before the final EIS is completed so that the true scope of the impact on the Federal Way community is known before the “preferred alternative” is selected.

In addition, there is no indication in the Draft EIS that there is NO other facility like Garage Town in the Puget Sound area. Relocation of those property owners is not feasible because there is NO equivalent facility for them to move into. Multiple businesses, landlords, and private owners would be eliminated from the community as a result. This adverse impact on the community should be clearly stated in the final EIS so that this undesirable outcome can be properly taken into account as the final siting decision is made.

Thank you for your attention in this matter.

Sincerely,
Edward C. Miller

I am writing to ask that you take the Garage Town Site (S 344th site) off of your list of potential locations.

There are several reasons for this request as a life time resident in the Puget Sound area I have had to look at the Midway landfill and it would only make sense to use a location as the next Transit Site.

Not only is Garage Town a very new development, but it is a location that affects 58 households whether for business or personal use and would create a hardship for all owners to find a new location especially as construction costs have skyrocketed and property values have continued to go up.

From an economic reason Garage Town is the only site that provides real estate and other taxes (S 344th street has 109 tax parcels) compare to the landfill site and Christian Faith Center site that has exemptions.

Christian Faith Center has shown interest in selling their site and would make it a win win for both buyer and seller.

It does not make sense for Sound Transit to pick a location where people will be losing their jobs and businesses (S 344th Site) compared to two other locations (landfill and Christian Faith Center) that would not affect businesses and employment.

For these reasons, I believe it is very clear that the S 344th site should no longer be a consideration for the new Sound Transit Location.

Subject: Environmental Impact Statement Comments

CAUTION: This email originated from a contact outside Sound Transit. Remember, do not click any links or open any attachments unless you recognize the sender and know the content is safe. Report any suspicious email by clicking the "fish" button in Outlook. Thank you! ST Information Security

Good morning,

As a potentially affected property owner of the OMF South project I would like to offer a couple of comments/concerns relative to the recently released draft environmental impact statement. I will begin my comments by saying I believe the correct decision would be the Midway site. I fully recognize the potential issues associated with this site but also believe not all avenues associated with mitigation (such as state and/or federal support) have been investigated.

As a property owner affected by the 344th site, I am dismayed that we do not get included as affected property owners because we are "not residents". The 55 + owners of individual condominium garages in the GarageTown complex have, in fact, invested hundreds of thousands of dollars in their units and yet do not get represented as "affected". We pay property taxes on those units, we maintain them and conduct daily activities, in may cases, at those units. Those interests and investments are not addressed in the draft statements and that is grossly unfair to the affected owners.

The second concern I have as a resident of the Federal Way community is the very adverse impact the 344th site would have on the community. The draft document addresses the number of new jobs and the volume of activity the OMF would create. It does not address the very restricted access to the 344th site and the adverse impact to businesses in the area. The 334th site is the only one of the three sites that does not have direct access from Hwy 99. The access routes to the 344th site is via three two lane avenues. If the plan is to improve access, those costs should be included in the cost of developing the site and not added as an afterthought.

As has been stated in a number of public comments that I have made over the last two years or so, the impact to our community is not being adequately addressed. Neighborhoods are being directly affected by property condemnation, noise pollution, environmental challenges, and loss of small businesses which are the heart and sole of our community.

The Board has an opportunity to do the right thing for the long term benefit of the region by choosing to mitigate the Midway site and turn a community eyesore into productive real estate.

Thank you for taking the time to understand the Communities concerns and the concerns of the property owners that support this community.

Scott Carson

1	I will begin my comments by saying I believe the correct decision would be the Midway site.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	I fully recognize the potential issues associated with this site but also believe not all avenues associated with mitigation (such as state and/or federal support) have been investigated.	Please see the responses to Common Comments 4 and 5 in Table L.1-1, Responses to Common Comments, in the Final EIS.
3	As a property owner affected by the 344thsite, I am dismayed that we do not get included as affected property owners because we are “not residents”. The 55 + owners of individual condominium garages in the GarageTown complex have, in fact, invested hundreds of thousands of dollars in their units and yet do not get represented as “affected”. We pay property taxes on those units, we maintain them and conduct daily activities, in may cases, at those units. Those interests and investments are not addressed in the draft statements and that is grossly unfair to the affected owners.	Please see the response to Common Comment 1 in Table L.1-1, Responses to Common Comments, in the Final EIS.
4	The second concern I have as a resident of the Federal Way community is the very adverse impact the 344thsite would have on the community. The draft document addresses the number of new jobs and the volume of activity the OMF would create. It does not address the very restricted access to the 344thsite and the adverse impact to businesses in the area.	Section 3.2, Transportation, and Section 3.5, Economics, of the 2023 Draft EIS and this Final EIS discuss site access and business impacts for each alternative. The South 344th Street Alternative is not expected to increase traffic congestion to surrounding streets.
5	The 334thsite is the only one of the three sites that does not have direct access from Hwy 99. The access routes to the 344thsite is via three two lane avenues. If the plan is to improve access, those costs should be included in the cost of developing the site and not added as an afterthought.	The conceptual capital cost estimates for each alternative include necessary transportation infrastructure improvements for access to and surrounding the site.

1	The Draft EIS does not correctly count the number of property owners and businesses that would be impacted by building the OMFS on the South 344th site. The Garage Town facility at 2010 S 344th Street is a condominium consisting of 67 individually-owned tax parcels. The Draft EIS does not classify Garage Town owners as commercial owners or residential owners and these individuals are not included in the count of property owners or parcels (even though occupants of a 4 plex were so counted). See Table ES-1 on page ES-17 of the Executive Summary. The table only shows 20 Residential and 11 Business Displacements for the entire South 344th Street Site. Garage Town alone has 67 separate individual Condominium parcels and owners. Also see Table 3.5-5 in the Draft EIS. This inaccurate count distorts the true number of individuals impacted in the data for the South 344th Street site contained in the Executive Summary. These inaccuracies must be corrected before the final EIS is completed so that the true scope of the impact on the Federal Way community is known before the "preferred alternative" is selected.	Please see the response to Common Comment 1 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	In addition, there is no indication in the Draft EIS that there is NO other facility like Garage Town in the Puget Sound area. Relocation of those property owners is not feasible because there is NO equivalent facility for them to move into. Multiple businesses, landlords, and private owners would be eliminated from the community as a result. This adverse impact on the community should be clearly stated in the final EIS so that this undesirable outcome can be properly taken into account as the final siting decision is made.	Please see the response to Common Comment 1 in Table L.1-1, Responses to Common Comments, in the Final EIS.

I am looking to have a representative speak to me about alternative sites and environmental impacts.
Please return a phone call to [redacted]

Is Sound Transit SERIOUS about finding another OMF site other than the 2 in Federal Way?
What is the appeal process and fees for Sound Transit?
Will the link line be elevated as it travels south bound I-5 @ S. 336th St.?
When will the rezoning process begin? This is zoned as multifamily currently.
Is Sound Transit aware of the Concomitant Agreement that runs with the Christian Faith Center Property? Citizens have fought against thoughtless development, and upheld the CA. What enables Sound Transit to think they are above this document that runs into purtuity.?
The proposed 2 sites in FW lie within Major Streams. The Hylebos is listed as Class A waters under State water quality standards.
The western portion of the first site lies within a Resource Stream Protection Area. This area was significantly altered to accommodate the Church in 2007. Should we allow further destruction to these wetlands, and tributaries, when they have already sustained the maximum mitigations?

Is Sound Transit considering the cumulative impacts of not only an OMF, but the link line, as well as the development planned for the Weyerhaeuser Campus. Supreme Court ruled the City and IRG (owners of Campus) will utilize the Hylebos Watershed Plan and that all development be seen through cumulative eyes and the impacts to environment. The CFC property runs with a Concomitant Agreement. This document runs forever. How will Sound Transit go about opening up this agreement? The OMF is a part of that cumulative response. This area CAN NOT take any more pressure. i-5 and your link line will already cause significant problems, adding the 24/7 OMF site in this area will undoubtedly spell the end of the East Branch. How can ST justify this?

While this property lies just outside of the aquifer recharge area, the Milton Redondo resources are fed by groundwater runoff from Northlake (head waters) Weyerhauser Campus and Christian FC. there is a well head capture zone on what I believe is DOT property, (next to Ellenos Yogurt. Also this business is our largest employer in Federal Way. They have spent over 5 million dollars in upgrading their facility. We should not be forcing this business or any others out of their property.

Do we think it is a conflict of interest for Parametrix to do the survey work when they are the same company that did the work for the Christian Faith Center?

Two other sites were chosen in 2017 Fife and S. 352nd St. What happened to these sites? They are both landfills. If the Midway dump is being dangled to the citizens (and let's be honest here, Midway is NEVER going to happen.) Sound Transit needs 3 options and putting a non-viable site in front of the people when it is NOT an option is less than transparent. So, if we would entertain the Midway landfill in all the time and $$ it would take to create, why can't we clean up The Kits Corner Puyallup landfill or the Fife landfill and place your facility in either spot. King County should clean this up as it is toxic to the land and residents. Heck you could easily buy the LLOYDs landfill, not technically a landfill, but yes, it is) clean that up, and have great access for trains coming off of I-5. The property recently sold and 2 million sq. ft of warehouses will occupy the site. I think your impervious impact would be less. Another option.

In this climate when Sound Transit is deficient in funds, these spots would be far less expensive and costly to the environment. The Kits Corner/Puyallup landfill is very doable. Public records request show emails from Sound Transit individuals all saying that for 20 million they can make anything flat, the census is that ST can do whatever they choose. Don't tell the public theses are possibilities, and that ST is open to new sites if that is not the case. According to one of your representatives, I was told that there will be NO other options to entertain. Your website and zoom meeting, all said this is NOT a done deal, and you will look at any viable site. Knowing the history to this property is key. I know what has been done in the past, anymore development, especially of this size, would forever eliminate, the Hylebos East Branch. This simply stated, CAN NOT HAPPEN.
I know another option can be had. I am forwarding these emails to Federal Way Council persons so we are all aware of other possibilities for the South OMF site.
I would enjoy a knowledgable representative to reach out some urgency. With the public comment ending on the 19th, I know you will want to do your due diligence and provide the public with information requested.

Thank you for your time.

Suzanne

Comment ID	**Comment Text**	**Response**
1	Is Sound Transit SERIOUS about finding another OMF site other than the 2 in Federal Way?	Sound Transit conducted an extensive alternative site assessment process in 2019 that resulted in the Sound Transit Board identifying the Midway Landfill, South 336th Street, and South 344th Street alternatives to study in the Draft EIS. More information can be found in the OMF South Alternatives Evaluation Technical Memorandum (https://www.soundtransit.org/sites/default/files/documents/operations-and-maintenance-facility-south-alternatives-evaluation-technical-memorandum.pdf).
2	What is the appeal process and fees for Sound Transit?	Sound Transit Resolution R2018-17 describes the agency's SEPA appeal process. Appeals must be filed in writing within 14 calendar days following the date the Final EIS is issued. The letter of appeal must be accompanied by a $200 fee.
3	Will the link line be elevated as it travels south bound I-5 @ S. 336th St.?	Under the current design, the mainline would be elevated along I-5 as it passes S 336th Street. See Figure ES-3 in the Final EIS Executive Summary.
4	When will the rezoning process begin? This is zoned as multifamily currently.	An Essential Public Facility is allowable under any zoning. As stated in Section 3.4, Land Use, of the 2023 Draft EIS and this Final EIS, OMF South is generally consistent with the city of Federal Way Comprehensive Plan as well as the intent of the zones that it would occupy within the footprints of the South 336th Street and South 344th Street alternatives. Sound Transit acknowledges that light rail transit facility uses are explicitly recognized only in the portion of the site zoned Commercial Enterprise (CE) and City Center Core (CC-E). Where the use is not explicitly recognized, Sound Transit will continue to meet zoning code and intent to the maximum extent practicable during the land use approval process.
5	Is Sound Transit aware of the Concomitant Agreement that runs with the Christian Faith Center Property? Citizens have fought against thoughtless development, and upheld the CA. What enables Sound Transit to think they are above this document that runs into perpetuity.?	Sound Transit is aware of the Concomitant Agreement and Development Agreement between the city of Federal Way and the Christian Faith Center for Development of Church and Private School. Sound Transit anticipates that a similar agreement would be developed with the city if OMF South is built in Federal Way.
6	The proposed 2 sites in FW lie within Major Streams. The Hylebos is listed as Class A waters under State water quality standards. The western portion of the first site lies within a Resource Stream Protection Area. This area was significantly altered to accommodate the Church in 2007. Should we allow further destruction to these wetlands, and tributaries, when they have already sustained the maximum mitigations?	Please see the response to Common Comment 3 in Table L.1-1, Responses to Common Comments, in the Final EIS.

7	Is Sound Transit considering the cumulative impacts of not only an OMF, but the link line, as well as the development planned for the Weyerhaeuser Campus. Supreme Court ruled the City and IRG (owners of Campus) will utilize the Hylebos Watershed Plan and that all development be seen through cumulative eyes and the impacts to environment. The CFC property runs with a Concomitant Agreement. This document runs forever. How will Sound Transit go about opening up this agreement? The OMF is a part of that cumulative response. This area CAN NOT take any more pressure. i-5 and your link line will already cause significant problems, adding the 24/7 OMF site in this area will undoubtedly spell the end of the East Branch. How can ST justify this?	Chapter 4 of the Draft EIS considers the cumulative effects of OMF South with other proposed projects in the area. It was updated for the 2023 Draft EIS and again for the Final EIS. Sound Transit would likely enter into a new Development Agreement with the city of Federal Way in addition to obtaining the environmental and development permits and approvals necessary to construct the project if the Board selects either the Preferred Alternative or South 344th Street Alternative to be built. The purpose of an EIS is to identify and disclose the impacts a project has the potential to cause and identify measures to avoid and minimize those impacts, ensuring that environmental considerations are part of project planning.
8	While this property lies just outside of the aquifer recharge area, the Milton Redondo resources are fed by groundwater runoff from Northlake (head waters) Weyerhauser Campus and Christian FC. there is a well head capture zone on what I believe is DOT property, (next to Ellenos Yogurt.	The area described in the comment is part of the regulated area defined by the city of Federal Way 100-year wellhead capture zone and is discussed in Section 3.11, Water Resources of the 2023 Draft EIS and this Final EIS.
9	Do we think it is a conflict of interest for Parametrix to do the survey work when they are the same company that did the work for the Christian Faith Center?	Parametrix prepared the EIS for the Christian Faith Center in 2004. No conflict of interest was identified for the OMF South project.
10	Two other sites were chosen in 2017 Fife and S. 352nd St. What happened to these sites? They are both landfills. If the Midway dump is being dangled to the citizens (and let's be honest here, Midway is NEVER going to happen.) Sound Transit needs 3 options and putting a non-viable site in front of the people when it is NOT an option is less than transparent. So, if we would entertain the Midway landfill in all the time and $$ it would take to create, why can't we clean up The Kits Corner Puyallup landfill or the Fife landfill and place your facility in either spot. King County should clean this up as it is toxic to the land and residents. Heck you could easily buy the LLOYDs landfill, not technically a landfill, but yes, it is) clean that up, and have great access for trains coming off of I-5.	The 2019 OMF South Alternatives Evaluation Technical Memorandum discusses the reasons that various sites were discounted as viable alternatives for OMF South. (https://www.soundtransit.org/sites/default/files/documents/operations-and-maintenance-facility-south-alternatives-evaluation-technical-memorandum.pdf).

"My name is Ben Gearford and my address is [redacted] and I think that you should choose the farthest South 344th Street location for an OMF South because it gets-us closest to Tacoma that's the most important it's got the least impact on wetlands and environment compared to the other two because I don't know if we wanna be digging up the dump and trucking it down the freeway for 6 1/2 years when we could be over and done with that and have a functioning OMF for a lot cheaper I don't know less urban place. I guess that's it. Thanks."

For certain your staff has a difficult task in presenting an unbiased picture of the choices to the board. So what I say I say only to be certain that my view of the matter is clear.

1 In the executive summary it is said that GT (Garage Town Association) has 50 owners, which sounds to me like a large partnership, which it is not. GT's owners have title to individual units, and they pay the tax thereon. Yet, they are not counted as businesses or as residents in the EIC enumeration.

2 GT is a unique entity in Western Washington. The EIC acknowledges that resettling us will be difficult. I suspect that it will be nigh impossible..

3 The EIC also acknowledges that it will be difficult for Ellenos yogurt to survive relocation. While the pandemic continues to be a threat I would hope that Sound Transit would wish to minimize collateral damage.

4 Every jurisdiction needs its tax money. Of the three sites under review, only one pays significant taxes. Let it be.

5 Like every other public transportation system in the World, Sound Transit is suffering a lack of riders and revenue at this moment. What looks at first glance to be a weakness of the site in Kent: that it will take several more years to complete, may offer the chance to save money now..

To: Sound Transit Board:

Subject: OMF South Best Option

To consider already developed sites containing business, churches, residences, and natural habitat for the OMF site is a counterproductive use of King County land. Public input in prior rounds of comments overwhelmingly supported using the Midway landfill site as the Prime Spot for this OMF facility. We The People - Tax Payers - Voters have made it clear to those we elected that Midway is our choice for OMF location. At this point that should be loud and clear to Sound Transit.

Regarding Midway site:

>> Public preferers using this site. Building at this location is done with consent of the electorate.

>> Business (jobs), churches, residences and natural habitat are not impacted.

>> Does not remove land availability from commercial/private use in an ever more densely populated

South King County. Therefore, is a better long-term stewardship of our finite land.

>> Places OMF immediately next to tracks already under construction. Supports fleet maintenance despite possible realignment and funding issues delaying expansion beyond Federal Way. Earlier start date possible.

>> Creates more south end jobs by not displacing those currently situated on Alternative Federal Way locations.

>> Cost delta between Midway and other projects is dwarfed compared to TDLE, Ballard, Everett, and Kirkland-Issaquah links costs.

>> Given lower revenues and higher costs focus on completing projects where dirt is currently being moved. Midway has equipment on site and freeway access. Build OMF there. It will support south end operations until such time it is financially feasible to expand south of Federal Way station.

Regarding South 344th Street site:

>> Business (jobs), churches, residences, natural habitat are impacted.

>> Ellenos Yogurt factory has approximately 150 employees, multi-millions of dollars in equipment and special licensing. Is the only industrial business in Federal Way.

>> Garage Town a community of 67 individually owned units (same as owning a condominium unit). Has modern substantial buildings including a clubhouse. They are used as extensions of households and to support businesses. Hence involves not just owners, units involve families/relatives and business owners/employees. Draft EIS does not classify Garage Town owners as commercial owners or residential owners. Only facility of its kind in western Washington.

>> Supports a broadcasting tower. Radio towers have certain land-configuration needs which must be addressed and special licensing.

>> This site is a hill with businesses and residences on all sides. Is not near level like other two sites.

>> Loss of existing family homes.

>> Loss of tax revenue for City of Federal Way and King County.

>> The City of Federal Way has conveyed to Sound Transit disapproval of any further acquisition of properties in their city. Loss of a portion of downtown retail acreage for rail station is plenty. Another municipality (Kent) would like to accommodate the OMF. Neither of the two Federal Way alternatives should be considered for use.

>> Loss of approximately 250 jobs. EIS needs to be updated to reflect the true facts on job losses.

Regarding both Federal Way sites:

>> Intersections supporting Interstate 5 access via South 320th and South 348th are very busy. Federal Way Police report that 348th & 16th Ave intersection is among busiest in the state. Increased traffic from construction will exacerbate this situation.

>> Those with connections to these sites are wearied from two years of OMF anxiety/suspense. Announcing selection of Midway site sooner rather than another year out will better serve these citizen's plans and nerves.

In closing:

Listen to the people's choice Sound Transit, the best land choice for the OMF is the Midway Landfill area. Will be a lot of unhappy voters out there if you choose otherwise.

Subject: OMF South Draft EIS Flawed Data

CAUTION: This email originated from a contact outside Sound Transit. Remember, do not click any links or open any attachments unless you recognize the sender and know the content is safe. Report any suspicious email by clicking the “fish” button in Outlook. Thank you! ST Information Security

Hello Sound Transit,

Of the 3 OMF South locations, only one will have a negative impact on residential homes, businesses, living wage jobs, and tax revenues.

I ask that the S. 344th St / Site 10A not be selected.

From the beginning of the scoping process, data has been flawed as recognized on the record by Dave Upthegrove, Claudia Balducci, Joe Mcdermott, Dow Constantine, Bruce Dammeier, Nancy Backus, and Peter Von Reichbauer.

Here are some errors found in the Draft EIS Document...there may be more:

The Draft EIS does not correctly count the number of property owners and businesses that would be impacted by building the OMF S on the South 344th St. / Site 10A.

The Garage Town facility at 2010 S 344th Street is a condominium consisting of 67 individually-owned tax parcels. The Draft EIS does not classify Garage Town owners as commercial owners or residential owners and these individuals are not included in the count of property owners or parcels (even though occupants of a 4 plex were so counted). See Table ES-1 on page ES-17 of the Executive Summary. The table only shows 20 Residential and 11 Business Displacements for the entire South 344th Street Site. Garage Town alone has 67 separate individual Condominium parcels and owners. Also see Table 3.5-5 in the Draft EIS.

This inaccurate count distorts the true number of individuals impacted in the data for the South 344th Street site contained in the Executive Summary. These inaccuracies must be corrected before the final EIS is completed so that the true scope of the impact on the Federal Way community is known before the “preferred alternative” is selected.

In addition, there is no indication in the Draft EIS that there is NO other facility like Garage Town in the Puget Sound area. Relocation of those property owners is not feasible because there is NO equivalent facility for them to move into. Multiple businesses, landlords, and private owners would be eliminated from the community as a result. This adverse impact on the community should be clearly stated in the final EIS so that this undesirable outcome can be properly taken into account as the final siting decision is made.

These are the same inaccuracies communicated to the board when Dave Upthegrove, Claudia Balducci, Joe Mcdermott, Dow Constantine, Bruce Dammeier, Nancy Backus, and Peter Von Reichbauer were present for public comment. This is very disappointing.

There is a role for government and it is to raise us to a better place without negatively impacting the lives and jobs in our community.

I ask that you not select the South 344th St. / 10A Site because the data you are receiving is flawed, and the impact to our homeowners, businesses, and working wage jobs would be significant.

Sincerely,

Peter Barbin

Subject: OMF South Draft Environmental Impact Statement comments

CAUTION: This email originated from a contact outside Sound Transit. Remember, do not click any links or open any attachments unless you recognize the sender and know the content is safe. Report any suspicious email by clicking the “fish” button in Outlook. Thank you! ST Information Security

Hello,

I am an owner of one of the units in the Garagetown (GT) complex which is part of the South 344th Street site being evaluated for the OMF South facility. My comments concerning the DEIS document and Executive Summary follow:

1) The DEIS did not include the 58 owners at GT as residential or business property owners. All 58 owners should be included as property owners. All 58 owners will be displaced if the S 344th site is chosen.

2) Table 3.3-2 in the DEIS should be changed to include an accurate count of the tax parcels. The S 336th site contains 19 tax parcels. The S 344th site contains 109 tax parcels. Each GT unit is a separate tax parcel.

3) The Midway landfill site is not on any tax rolls and its use would not negatively impact tax revenue for any of the surrounding communities.

4) The DEIS states, on Page 3.6-9: "The South 344th Street alternative would impact the most social resources and would have the greatest number of business and residential displacements as compared with the other build alternatives." This statement of fact was not in the Executive Summary and should be included.

5) Using the MIdway landfill site would displace the fewest number of businesses, churches and individuals. It also would have the lowest economic impact on the surrounding communities. If the S 336th site is chosen, 94 jobs will be lost. If the S 344th site is chosen, 248 jobs will be lost. These are the reasons I strongly urge and support the use of the Midway landfill site for OMF South.

Sincerely,

Malcolm L. Klug
[redacted]

Malcom Klug (Communication ID 473642)		
Comment ID	**Comment Text**	**Response**
1	The DEIS did not include the 58 GT owners as residential or business property owners. All 58 Garage Town owners should be included as property owners. All 58 owners will be displaced if the S 344th site is chosen.	Please see the response to Common Comment 1 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	Table 3.3-2 in the DEIS, should be changed to include an accurate count of the tax parcels. The S 336th site contains 19 tax parcels; The S 344th Street site contains 109 tax parcels. Each GT unit is a separate tax parcel.	Please see the response to Common Comment 1 in Table L.1-1, Responses to Common Comments, in the Final EIS.
3	The Midway landfill site is not on any tax rolls and its use would not negatively impact tax revenue for any of the surrounding communities.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
4	The Draft EIS states, on page 3.6-9: “The South 344th Street alternative would impact the most social resources and would have the greatest number of business and residential displacements as compared with the other build alternatives.” This statement of fact was not in the DEIS Executive Summary, and it should be included.	Table ES-1 in the Final EIS Executive Summary includes a comparison of key characteristics and impacts of all three build alternatives. Within the table, the Acquisitions subsection contains the total number of displaced businesses and residences, and the Environmental Justice, Social Resources, Community Facilities, and Neighborhoods subsection contains the number of displaced social and community resources. Additionally, Figure ES-9 and the associated Acquisitions, Land Use, and Economics text within Section ES.3, Comparison of Alternatives of the Executive Summary expands on these impacts.
5	Using the Midway landfill site would displace the fewest number of businesses, churches and individuals. It also would have the lowest economic impact on the surrounding communities. If the S 336th site is chosen, 94 jobs will be lost. If the S 344th site is chosen, 248 jobs will be lost. These are the reasons I strongly urge and support the use of the Midway landfill site for OMF South.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.

Subject: Sound Transit Operations and Maintenance Facility South

CAUTION: This email originated from a contact outside Sound Transit. Remember, do not click any links or open any attachments unless you recognize the sender and know the content is safe. Report any suspicious email by clicking the “fish” button in Outlook. Thank you! ST Information Security

Mr. Rehmat:

I understand that letters expressing opinions regarding the Sound Transit Operations and Maintenance Facility - South should be directed to you.

Having taken a look at DEIS comments on the topic, I hope that the Sound Transit Board chooses the Midway Landfill site for the new facility. It would be a great use of public resources to put to good public use a landfill site that is mostly vacant property. This use of property would be the best from an environmental perspective, since it puts to productive use, and cleans up, a historical environmental problem. The DEIS comments note that no wetlands or water sources would be adversely effected. Also, this site is best for people: it would preserve the most jobs, businesses, and residences.

The worst possible location is the South 344th Street site. I urge you not to select that site. Doing so would negatively affect the greatest number of businesses (and therefore employees), and residences (and therefore families) of Federal Way. It would also have the greatest negative effect on the tax base of Federal Way, resulting in increased costs for other residents of Federal Way.

I hope Sound Transit takes seriously its responsibility to be a good neighbor and to limit as much as possible the harm cause to people and the environment by the selection of the new OMF site. I’m confident that if Sound Transit does focus on that responsibility, it will select the mostly-empty Landfill site and avoid the South 344th Street site.

Thank you,

James Haigh

Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	The worst possible location is the South 344thStreet site. I urge you not to select that site. Doing so would negatively affect the greatest number of businesses (and therefore employees), and residences (and therefore families) of Federal Way. It would also have the greatest negative effect on the tax base of Federal Way, resulting in increased costs for other residents of Federal Way.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.

Dear Mr. Rehmat:

I write in support of the Sound Transit Board selecting the Midway Landfill site for its new maintenance facility. That site would be a great use of vacant property, would not harm the environment other than a small number of trees, would not cause anyone to lose their homes, would not cause anyone to lose their jobs, and would not cause Federal Way and other governments to lose needed tax revenue.

The second best option is the South 336th Street site because an old church facility can more easily be replaced than other facilities and Federal Way tax revenue, jobs and residences would not be adversely effected.

The worst option is the South 344th Street site, which would displace the greatest number of jobs, businesses, and residences, thereby significantly adversely affecting the tax base and people of Federal Way.

I hope the Sound Transit Board makes the right decision for people and for the environment and selects the Midway Landfill site, and avoids the South 344th St. site that would be by far the worst outcome for the businesses, employees, and residents of Federal Way.

Regards,

Gia Haigh

I watched you omfsouth presentation on the internet and had a few comments.

1) Why are you parking so many trains. They should be on the tracks moving people or being serviced. 24 hour service for all areas will encourage the best use of the vehicles and will allow businesses to best use their facilities by having round the clock use of their capital expenditures as well. Daytime only train service leaves people stranded, limits a significant section of the population from using the transit system and necessitates the huge expenditure of storing trains while not running. Calculate the size of service facilities needed to keep the trains all running, spend the money there and provide 24/7 service at a lower cost.
2) If you provided 24/7 service, the daytime load would lessen and you would not need to have as many trains running.
3) Building on the landfill is expensive because of two factors: foundation support and hazardous soil removal. You can eliminate both of those costs by building the parking and support facilities under the rail lines on the floor of the landfill and have the facilities be underground where they will be more energy efficient and then the soil does not need to leave the site. Proper ventilation needs to be in the buildings anyways and then the surface could also have a solar power plant that returns value and resources to the community around the train yard without the noise and ugliness of a train yard being seen.

Sincerely,
Alex Bruski

Daytime only train service leaves people stranded, limits a significant section of the population from using the transit system and necessitates the huge expenditure of storing trains while not running. Calculate the size of service facilities needed to keep the trains all running, spend the money there and provide 24/7 service at a lower cost.	A new OMF is needed in the South Sound to receive, test, commission, store, and service a larger train fleet to support future light rail extensions to Tacoma and West Seattle and throughout the region. An OMF is where LRVs go for necessary cleaning and care. Link light rail operates 20 hours a day and is closed from 1 to 5 a.m. except on Sundays, when service ends at midnight. These overnight closures are vital for maintaining the system and ensuring it is in good working order over the long run.
2	Building on the landfill is expensive because of two factors: foundation support and hazardous soil removal. You can eliminate both of those costs by building the parking and support facilities under the rail lines on the floor of the landfill and have the facilities be underground where they will be more energy efficient and then the soil does not need to leave the site. Proper ventilation needs to be in the buildings anyways and then the surface could also have a solar power plant that returns value and resources to the community around the train yard without the noise and ugliness of a train yard being seen.	Building and operating a below-grade OMF would be prohibitively expensive and pose concerns over worker safety and exposure to landfill gases.

CAUTION: This email originated from a contact outside Sound Transit. Remember, do not click any links or open any attachments unless you recognize the sender and know the content is safe. Report any suspicious email by clicking the "fish" button in Outlook. Thank you! ST Information Security

I am writing to you in opposition of the south sound OMF being built along/at 20th Ave S. or 16th Ave S. in Federal Way. Out of the three options available both of these options would create significant environmental, residential, business related impacts for our community. The current zoning at the Christain Faith Center is multi family. Zoning for the OMF would be Heavy Industrial Equipment. Heavy equipment zoning in not tolerated so close to the protected Hybelos Creek as it lies within a Resource Protection area. Both of the mentioned sites have portions Hylebos waterway within them. Federal Way has inventoried and classified these creeks as MAJOR STREAMS. The Hylebos is listed as Class A waters under State Water quality standards. Residential neighborhoods pre- existing the Business Park zoning in the area and has persisted as a single- family residential area for more than two decades. This also does not account for the residential areas near the proposed locations that would experience elevated levels of environmental pollution.

Ellenos Yogurt is the large employer in the city of Federal Way. The OMF would displace this business. This company has spent over 5 million dollars upgrading their facility in the last few years. They and the other surrounding businesses should not have to vacate, especially in today's climate, where small businesses are struggling to survive. We are proud of this local business and they have our full support. d

The collective impacts to businesses/residents in Federal Way from Sound Transit is extensive. The presence of your facilities/stations/lines/link should not be wherever one happens to be in Federal Way. Sound Transit please find another location for your OMF.

During the construction of the church in 2004, 35,936 sq. ft. of wetlands were displaced/filled in order to create the largest church campus in the state. This area is a part of the International Flight Pathway. Over 150 migratory birds depend on the Hylebos and the surroundings for rest, food and water. The Resource Protection area would be eliminated/buried if the link line is not elevated, as it is in direct line of the Hylebos. This land cannot tolerate any more abuses or alterations. The allotted percentage for this space to be developed, was taken 20 years ago. This land needs to remain as is.

The head waters for the East Branch of the Hylebos are received viaf North Lake less than 1/8 of a mile from this proposed site. These waters are paramount for downstream

juvenile salmon recovery. Macrobenthic invertebrate must travel freely along trees, rocks and water.   Culverting the Hylebos at this critical junction goes against the entire purpose of the Executive Proposed Hyebos and Lower Puget Sound Watershed Plan. This document created in the 1990’s is a roadmap for thoughtful development to the Hylebos. Allowing not only the link line, but the extra line of track to reach OMF, on top of an OMF, at either site in Federal Way is utterly mindboggling in regards to environmental impacts. The residents of Federal Way remember the planning process for the church, vividly!   It took 4 years to finally settle on a compromise and protections for the waterway. The citizens of Federal Way are not going to allow your facility to be built here. The once beautiful forest and its inhabitants was taken from us once. Any further manipulations to the property will destroy what is left of the wetland connectivity and water quantity in the East Branch of the Hylebos.
Sound Transit please find another location for your OMF.

The Midway Landfill is the most obvious choice and one I support. While the costs and time frame for construction are both higher than the Federal Way options, we (the smaller and greater community) are the reason the landfill is a landfill. Why not take the opportunity to invest in our environment and in our communities and give the landfill land a new purpose instead of passing the buck and significantly impacting yet another community. Or could you please revisit your #1 (S. 352nd St.) & #4 (Fife) site options that WERE discussed 2017?

Both of these options are landfills that received toxic dumping’s from Boeing and Ararco. Site #1 is an environmental nightmare because this land was never created to serve or function as a land fill, nor was this dumping site closed properly. The Petroleum pipeline that runs parallel with I-5, also runs through a portion of this land. This line was installed with NO protective barriers. The line now serves as a conduit for leachates, and aids their distribution into our aquifer/ Hylebos watershed.

Couldn’t this be a win win for the environment, residents and Sound transit?

The citizens of Federal Way have spent the last 5 years fighting to protect and preserve the former Weyerhaeuser Campus that lies just East of these proposed sites. We have fought against the unprecedented traffic impacts that will result if the Campus is fully built out. With Highway 18 and 320th St. at maximum failure today, the S. 336th St. offers residents a way to reach our city establishments. Supreme Court recently ruled the City of Federal Way and IRG WILL adhere to the Executive Proposed Hylebos Watershed Plan as well as view any developments through cumulative eyes in regards to environmental impacts. The church site demands this total lens as it is a part of the original Weyerhaeuser Campus/Forest. Our city is already being accommodating for the link line and transfer stations being built along 320th. How much more will Federal Way have to endure?

We will not allow Sound Transit to hold us hostage for the next 10 years. You must work with the citizens of Federal Way. Mayor Strong council leaves our Council members and citizens very little voice in how our city functions. Sound Transit is NOT the city of Federal Way and the citizens should be heard and respected as our concerns are valid.

You told citizens in print as well as at Zoom meeting, that this was not a done deal. One of your representatives along with FW council members have shared bluntly that the decision HAS been made to put the OMF at either FW sites. This certainly shows a serious conflict of interest and one that needs to made transparent to all going forward. Sound Transit is said to be misleading and confuses the public. For instance: staging public meetings and telling the public their input is needed and valued, only to find out events are for trivial items like art installations. Sound Transit then takes public input on Art and transfers that into dialogue and discussion on the important items like an OMF. Transparency is vital and should be upheld to the highest standards.
I am confident a better solution for your facility can and will be found. It will not be within the city limits.

Thank you for your time and thoughtful consideration.

Subject: Errors and Omissions in OMF South Draft Environmental Impact Statement (DEIS)

CAUTION: This email originated from a contact outside Sound Transit. Remember, do not click any links or open any attachments unless you recognize the sender and know the content is safe. Report any suspicious email by clicking the “fish” button in Outlook. Thank you! ST Information Security

To all who are evaluating the OMF DEIS,

The Draft EIS is a good effort but does not accurately nor fully reflect the impacts of the selection of an OMF South site.
There is much to be considered and how it will affect the community where the OMF is eventually located. The Draft EIS appears to have some flaws and omissions in the DEIS and how it is evaluated.

PEOPLE AFFECTED

The 344th site relies on estimates of the employees in the various businesses and largely discounts the owners of Garage Town condominium (They are included only as a footnote on page 17 in the EIS). It appears that the Sixty-Seven, 67, parcels in GT aren’t really significant because they are not live-in residences nor full blown business fronts … in short the **owners of 67 parcels** that comprise Garage Town really **don’t count** for anything in the EIS.

344th site:
At the very least 276 lives affected including GT owners
By far the largest number of people and jobs affected than any other site.

336th site:
The fewest number of people affected at this site.

Midway Landfill:
Slightly more people than the 336th site

JOBS and REVENUE

The OMF will have a significant effect on the jobs and revenue supported by the sites under consideration.

344th site:
How many jobs will be eliminated by the OMF if this site is chosen .... Many more than the estimate in the EIS,
especially if you count the people working for the businesses in Garage Town and surrounding areas. Sound Transit making a guess of how many jobs are affected is not a good way, when the demographics aren't a simple matter of assigning "x" jobs to this business and a "y" to that business and so on. What about the jobs that will be lost to outside companies that come in to support all the business and GT units.

GT is a concentration of taxable properties Together with the other properties this site generates twice the revenue of
the 336th site and over three times the revenue of the Midway Landfill site.

336th site:
A large portion of this site generates little revenue for the for King County and Federal Way.
Less than half of the344th site.

Midway Landfill
This site generate one-sixth of the revenue of the 344th site.

Although I am not a "resident" or operate a store front at this site I do pay approximately $3,000 every year to King County and Federal Way in property tax. I also concentrate a lot of my shopping in Federal Way because I often go to Garage Town to work on various projects. Multiply this by the the Garage Town owners and other businesses and by not choosing the Midway Landfill you will be denying a significant source of increasing revenue to King County, Federal Way and local businesses each and every year.

COSTS

In the long run the Midway Landfill is probably the cheapest alternative when you consider that the other two options take away hundreds of jobs and valuable tax base from the community forever, while the Midway Landfill takes away the least and adds the most in terms of jobs and mitigates the most environmental impact if done correctly. I don't feel enough emphasis has been given in the EIS to these costs to the community.

The long term benefits to choosing the landfill are enormous in terms of minimal environmental impact (not messing with forests and streams that would be best left alone). Using the Midway Landfill would help fix an existing environmental problem without creating new environmental concerns and ecological costs to the Federal Way Community.

ESTHETICS & ENVIRONMENT

Using either the 336th or 334th site would add an eye-sore to the Federal Way community, light pollution and noise pollution to the
community. Federal Way has precious few undisturbed habitats ... why disturb more ecological niches more by not using the Midway landfill. These Environmental problems can be avoided by choosing the Federal Way Landfill.

SUMMARY

While the DEIS appears to be impartial in its evaluation criteria, it seems that several important data and concerns have been downplayed or omitted in it. There are far more people than indicated in the DEIS that would have to be relocated were the 344th site be chosen, yet there is NO place to relocate to!

These is NO WHERE in King County to relocate a facility like Garage Town. Garage Town is an unique facility, with no peer in King County or any other surrounding county. Likewise Elenos Yogurt was specifically located where it is now because of the environment of the surrounding area, not just the property where it is located.

It's obvious the OMF Team has done its best to create a fair and balanced evaluation of the three sites being considered for the
OMF. However, I believe they have inadvertently overlooked some of the unique circumstances involved with the various properties, property owners and "resident" population. Just because people don't operate a business or live on their property, doesn't mean people aren't significantly affected by the decisions to be made about and have a vested the OMF South location.

Since the Midway Landfill is a "Superfund" site, it would appear that some funds might be available to help clean it up decreasing the estimated costs to Sound Transit significantly.

This e-mail is an attempt to bring some of these concerns and considerations to be included and properly weighed in the final EIS

Sincerely,

Arnold DeWalt

Arnold Dewalt (Communication ID 473818)

Subject: OMF facility

CAUTION: This email originated from a contact outside Sound Transit. Remember, do not click any links or open any attachments unless you recognize the sender and know the content is safe. Report any suspicious email by clicking the “fish” button in Outlook. Thank you! ST Information Security

Hello,

My name is Paula Baerenewald. I am a 23-year resident of Federal Way. I am strongly opposed to the OMF facility being built anywhere but the Superfund site. Building the OMF on any of the other proposed sites would be extremely disruptive to businesses that have decided to call Federal Way home. Cities in South West King County have the lowest socioeconomic status in King County. In order to lift South West King County up, and create economic diversity, we need to boost economic development not destroy it. Destroying businesses for the OMF will cause them to leave South West King County and will be counter-productive to our goal of economic improvements. Destroying businesses in South West King County will disproportionately impact the lowest-wage earners, earners who live and work in Federal Way, many of whom are people of color. To mitigate the economic impact to the lowest wage earners, Sound Transit needs to find a site with the least economic impact on the community.

While I have heard that the Superfund site would be more expensive to build on, it will have the least impact on existing Federal Way businesses and therefore on Federal Way's economic base. The Superfund site is the most useful for the OMF and construction on Superfund sites for the greater good of a community is not a novel concept. One of the most successful Superfund Re-purposing projects has been the Ruston Waterfront project in Tacoma as an example. Re-purposing one of the Midway Landfills, which are capped Superfund sites, is not new in WA state as there are many such projects where community improvements have been built upon capped sites. In this link below, you will be able to read about a variety of successful uses for Superfund Sites across the nation and you can read specifically about capped sites. https://www.epa.gov/superfund-redevelopment-initiative/superfund-site-use-spotlights

Building on the Midway Landfill site is the most desireable and makes the most sense so not to have a disproportionate impact on the Federal Way community, the part of South West King County that needs the most economic development to lift up South West King County's lowest income earners. It was reported that you anticipate that there may be problems with development of the Midway Landfill that may delay your opening in 2026. For this reason, I urged you to begin working on taking care of the EPA issues early on in this process. About 2-3 years ago. If you did not, then there I believe that this midway landfill was not really a choice. In fact it was presented as a false choice, a decoy. There is precedent for developments of these capped Superfund sites. You can do it. Preserve the businesses of South West King County. Preserve the potential for improved economic development. Develop the Superfund site for the greater good of our struggling community. If you can not, I urge you instead to re-consider your previous options #1 and #4 that you presented in 2017. Show South West King County, its businesses, its employees and residents that they are an important part of the future of the Puget Sound with your thoughtful action on this request.

Regards,
Paula Baerenwald

Destroying businesses in South West King County will disproportionately impact the lowest-wage earners, earners who live and work in Federal Way, many of whom are people of color. To mitigate the economic impact to the lowest wage earners, Sound Transit needs to find a site with the least economic impact on the community.	When developing the OMF South alternatives, Sound Transit used several measures to avoid and minimize potential property impacts, including business displacements. Section 3.5, Economics, of the Draft EIS and this Final EIS describes the impacts to businesses and employees for each build alternative. For all build alternatives, the estimated number of displaced employees is small compared with the employment base in the study area. These estimates do not necessarily reflect job losses in the region because some businesses may choose to relocate in the area. As discussed in Section 3.3, Acquisitions, Displacements, and Relocations, of the 2023 Draft EIS and this Final EIS, Sound Transit would provide relocation assistance to displaced businesses. While relocation is up to the individual business owner, the relocation analysis found that adequate commercial and industrial spaces are available to relocate displaced businesses.

EIS Draft needs correct some numbers

Ken Broyles [redacted]

Sat 4/17/2021 10:45 AM

To:OMFSouthDEIS <OMFSouthDEIS@soundtransit.org>

CAUTION: This email originated from a contact outside Sound Transit. Remember, do not click any links or open any attachments unless you recognize the sender and know the content is safe. Report any suspicious email by clicking the “fish” button in Outlook. Thank you! ST Information Security

I looked over the Draft EIS & it does not correctly count the number of property owners and businesses that would be impacted by building the OMFS on the South 344th site. I not sure why because Sound Transit send out fliers to all of the 67 owners & businesses within GarageTown.

Even at the 1st meeting I went to back in 2019 Sound Transit said on the 344th site there were only 35 residents & businesses that would be effected if the OMF was built on site. When an owner at GarageTown got up to speak for the 3 minutes and said I'm not sure where you came up with that 35 number because we have 67 units that pay taxes ever year on their owned property at GarageTown.

I just want the EIS daft to be fair and accurate. Hopefully this mistake can be fixed in the draft before it is put up to a vote by the board members of Sound Transit.

I have looked all over to try & find a similar facility in Western Washington to buy & move if my garage to if Sound Transit decided to build the OMF on the 344th site. I have not been able to find anything similar.

Best Regards, Kenneth Broyles

Board Members,

I just would like to let you know you need to choose another site for your OMF and leave the 344th site alone. My brother and I have spend a lot of time at my Grandpa's garage learning how to use tools and work on projects. My Grandpa told me that when he was growing up there were classes in school to teach woodworking, metal shop, welding automotive classes. He has taught us so much and we love going there to learn. Also there are a lot of new friends and neighbors that we have met over the years at the 344th site. So please consider one of the other 2 sites for the OMF and leave my Grandpa's garage alone. We have a lot more to learn because schools don't offer classes like this anymore.

Thank you, Tyler Broyles

I strongly oppose both Federal Way sites in favor of the Midway Landfill Full Excavation alternative. The full excavation appears to be the least expensive of the options at the landfill. The only reason provided in the draft EIS not to build on the Midway Landfill is the higher cost. With the increasing economic division across the county, Federal Way cannot afford to lose jobs, homes, community connections, and funding from property tax revenue. It is time that King County invest in the south end of the county. The impacts to our wetlands and streams are an important and lasting environmental impact as well. The cost to our community long term of putting the OMF South in Federal Way could be far greater than the immediate expense consideration. If the funds are not immediately available, I would hope that there could be Federal Grand funding for the superfund site or other sources of funding that are unique to this site. Building the OMF site in Federal Way is not an equitable option and the Midway site is a win-win for all communities and worth the investment for our communities.

Charae Ashcraft

My first question needs to be - why do you need so many maintenance facilities? How many over paid union screwdrivers do we need to pay for? How many businesses and residences have to be bought (with my tax dollars)? Build these facilities in the least dense areas. Only an engineer comes up with crazy ideas like this. The train goes each direction, you only need 4 trains, there could be a couple ready for a breakdown, but there is no reason for a fleet of trains doing nothing. I am uncertain when this project will pay off, as it is unlikely to get used as you think. It's going to become a day/night trip for the homeless. Extend the line now, and build in Fife. Right now, it's all about how to waste the tax dollars. How about finishing one project before moving to another - just look at the airport -- what a mess.

Charae Ashcraft (Communications ID 474299)

Carol Qually

The Christian Faith Center is the worse site of all. It is too close to the west side of North Lake which had Herons, Eagles and Osprey fishing on the lake. Just yesterday (4/13/21) I was able to watch a heron fishing from several points along the lake on the unpopulated west side. The eagles fly to the west with their catches to feed their young and immature chicks. The Midway property is the best as there are no huge trees to shelter eagles and osprey nests. Midway is closer to a non-residential area and easier to reach than the North Lake property. Runoff and noise will impact these birds and drive them away. Please think of our environment while making your plans. Thank you

Carol Qually (Communications ID 474300)		
Comment ID	**Comment Text**	**Response**
1	The Christian Faith Center is the worse site of all. It is too close to the west side of North Lake which had Herons, Eagles and Osprey fishing on the lake.	The South 336th Street site is on the west side of the I-5 corridor and would therefore not have any anticipated impacts to North Lake or its surrounding vegetation or wildlife.
2	The Midway property is the best as there are no huge trees to shelter eagles and osprey nests. Midway is closer to a non-residential area and easier to reach than the North Lake property.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.

Please buy us out. This neighborhood isn't that great. We don't have kids playing at each other's houses and riding bikes and whatnot. We're not a super friendly street. Plus, the proximity to Walmart means we have a lot of random people walking by, good and bad. We've also had a lot of vehicle break ins. Anyway, I know the public seems to have a concern for the forested space between the buildings and I5, and there's really not much there. Its mostly blackberry brambles taking over some trees. There isn't much wildlife back there. The only concern is the amount of wildlife around the retention pond by the mega church, but I'm sure they'll be able to find a new home in Weyerhaeuser. Also, there are often homeless people living back there, so, its not like anyone can enjoy it anyway. I think the saddest loss would be Ellenos Yogurt. For some reason they're saying they won't be able to start over, but with the right amount, I'm sure they could. I just hope they don't give up. But its not like they have a storefront, so they don't really involve the community. The company just exists in an old sports equipment building and then you see their yogurt in stores. Actually, most of the businesses in that area don't involve the public with a storefront. So its not like it'll be a big blow to the community.

Shannan StClair

The Midway Landfill is the best overall option. Even with the additional cost for site environmental mitigation. Both Federal Way sites will disrupt/remove local important local businesses and community organizations which are integral to that community's growth. If either FW site is chosen, the traffic impact to the main SW Federal Way arterials/roadways would be enormous. It is already incredibly difficult to get around that area with all the new truck traffic from Port of Tacoma as well as the enormous strain that would be placed on the Enchanted Parkway from SW 348th southward. I would like to add that the continued targeting of Federal Way as the depository for all things "industrial" and "dirty" is not doing our community any good. We are struggling to build/rebuild a positive identity and being continually targeted as King County's dumping ground is not acceptable. There are many long time citizens of Federal Way who have worked too long and too hard to try and keep Federal Way a nice place to live and raise a family. Placing the maintenance facility in Federal Way will put a coffin in the city's ability to work on growing as a family-centric community, as opposed to being a dumping site. Please choose the Midway Landfill site. It makes the best, overall sense.

Shannan StClair (Communications ID 474307)

1	The Midway Landfill is the best overall option. Even with the additional cost for site environmental mitigation. Both Federal Way sites will disrupt/remove local important local businesses and community organizations which are integral to that community's growth.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	If either FW site is chosen, the traffic impact to the main SW Federal Way arterials/roadways would be enormous. It is already incredibly difficult to get around that area with all the new truck traffic from Port of Tacoma as well as the enormous strain that would be placed on the Enchanted Parkway from SW 348th southward.	Section 3.2, Transportation, and Appendix G1, Transportation Technical Report, of the 2023 Draft EIS and this Final EIS evaluate traffic impacts of the OMF South. The analysis found that there would be no long-term impacts to arterial and local street operations from either the Preferred or South 344th Street alternatives.
3	I would like to add that the continued targeting of Federal Way as the depository for all things "industrial" and "dirty" is not doing our community any good. We are struggling to build/rebuild a positive identity and being continually targeted as King County's dumping ground is not acceptable. There are many long time citizens of Federal Way who have worked too long and too hard to try and keep Federal Way a nice place to live and raise a family. Placing the maintenance facility in Federal Way will put a coffin in the city's ability to work on growing as a family-centric community, as opposed to being a dumping site.	As described in Chapter 1, Purpose and Need, of the 2023 Draft EIS and this Final EIS, the expansion of Link light rail service under Sound Transit 3 requires four operations and maintenance facilities to operate. There are two existing operation and maintenance facilities: OMF Central in Seattle and OMF East in Bellevue. Two new operation and maintenance facilities would be needed in the North and South corridors of the Link light rail system. Section 2.2, Alternatives Development and Scoping, of the Final EIS describes the sites Sound Transit evaluated in the South Corridor of the system as part of the alternatives development process. This included locations in Kent, Federal Way, Fife, and Tacoma. The Sound Transit Board identified three sites for further study in the Environmental Impact Statement, one in Kent and two in Federal Way.

Glenn Chouinard

I am a resident and manager of a business in Federal Way. I bought my home 21 years ago based on the vision of Light Rail in Federal Way. It was not perceived that it would take a quarter of a century for it to happen. My business is located off S. 336th Street so I am well aware of the conditions on both sites. As a transportation professional, since day 1 I have believed that the Midway Landfill alternative should be the preferred alternative, regardless of costs and schedule to construct. The most important aspect of this site is that it allows the reclamation of the landfill site through a costly but public infrastructure investment. As a superfund site, the federal and state government would allow this site to remain as wasted property and a risk to future opportunities. In addition the environmental impacts are minimal when compared to the southern sites. In particular, the disruption to the man-made and natural environment are clearly less as are the socioeconomic impacts. It is recognized that Sound Transits position is to charge ahead without obstacles at this phase of the project. The track record I have observed is one that often lacks in true mitigation, such as traffic access and impacts not controlled by federal or state agencies, at the cost to the local communities. That mitigation is far simpler and more easily identifiable for the landfill site. A lock in of this decision is forever in the project development process. Please do not be short sighted.

Steven Dent

I would like to express my concerns about location the OMF south at either of the Federal Way sites. The Kent Landfill site seems better suited for the OMF site with simplified access to existing tracks, cleaner access to Hwy 99 and I-5 for staff, and less impact to surrounding residential property and businesses. The Federal Way site may be "cheaper" to build and have a lower projected operating cost but has more negative impacts to surrounding wet-lands and residential property.

Steven Dent (Communications ID 474317)

I get the uneasy felling that Sound Transit has made their decision not to use the Midway site. The old landfill site does pose some construction challenges they wants to avoid. The maintenance facility in South Seattle was built over tide flats that were filled in. The tracks and buildings appear to be doing OK in that area. I fell the Midway site would put to use a large vacant land area and not displace any residents or businesses.

I. Believe the landfill option is too expensive and will delay the process. I think the church option is not desirable because of the 2 streams that will need to be rerouted. I think the 3rd option is best. The Elenos Yogurt plant and other businesses can find other places to relocate their business within Federal Way. There are lots of empty buildings available. Same with the residents. With the help of Sound Transit's relocation team, the residents will find other places to call home. This is not a desirable place to live because of the crime. My choice is the 3rd option. Thanks for listening.

I think you should locate the new maintenance facility at the Midway Landfill. It's the only site that doesn't require existing businesses to relocate. Even though there may be some site cleanup required from the landfill it has to be more cost effective and less disruptive than the other two options. Plus, what else would the old landfill site ever be used for if not the maintenance facility. It is adjacent to I-5 for easy freeway access. I think the landfill site is a no brainer.

David Kingstone

I'm an owner of Unit B22 at Garage Town, which will be impacted if the South 344th Street is chosen. Three comments: 1. Having visited both the Seattle and Bellevue Maintenance Facilities, they are built on 'billiard table' flat land. This makes the Midway Landfill site the most suitable location, as it uninhabited and flat and immediately adjacent to the light rail tracks already under construction to Federal Way. All these criteria make Midway the most obvious choice, especially if there is any delay in the further extension to Tacoma. 2. Given the South 344th site impacts the highest number of properties, businesses and jobs, I found it difficult to believe that the cost of developing this site was the same as that at South 336th, especially given the physical geography of this site is even to the untrained eye more difficult to navigate/excavate, plus the large number of properties to purchase alone) must make this option significantly more expensive. 3. Throughout the EIS, there is no mention of the weighting given to each of the different assessed study criteria, i.e. what are the most important criteria that the Board will consider. I would request, in the interests of transparency, that these weightings be shared publicly, so we can understand how the final decision will be calculated and arrived at. Midway is the way to go. I trust the Board will make its decision in this direction. Best for the community at large. Many thanks for your consideration, Dave Kingstone, Kenmore, WA (04/15/2021)

1	Having visited both the Seattle and Bellevue Maintenance Facilities, they are built on 'billiard table' flat land. This makes the Midway Landfill site the most suitable location, as it uninhabited and flat and immediately adjacent to the light rail tracks already under construction to Federal Way. All these criteria make Midway the most obvious choice, especially if there is any delay in the further extension to Tacoma.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	Given the South 344th site impacts the highest number of properties, businesses and jobs, I found it difficult to believe that the cost of developing this site was the same as that at South 336th, especially given the physical geography of this site is even to the untrained eye more difficult to navigate/excavate, plus the large number of properties to purchase alone must make this option significantly more expensive.	Table 2.5-1, Opinion of Probable Cost for Preliminary Engineering Design of the Build Alternatives, in Chapter 2 of the Final EIS shows the opinion of probable cost estimates for each OMF South build alternative broken out by real estate and relocation, final design and construction, and total capital preliminary estimate. At this early stage of the project, these numbers are provided for comparative purposes only. A more detailed estimate will be developed as the project advances through design.
3	Throughout the EIS, there is no mention of the weighting given to each of the different assessed study criteria, i.e. what are the most important criteria that the Board will consider. I would request, in the interests of transparency, that these weightings be shared publicly, so we can understand how the final decision will be calculated and arrived at.	The different elements of the environment studied in the EIS are not weighted. The Sound Transit Board will consider the findings in the Final EIS, comments on the Draft EIS, and other factors when selecting the project to be built.

RE: OMF location in South King County

Dear Mr. Hussein Rehmat;

Sound Transit is currently considering three (3) potential alternatives for the location of the new South Operations and Maintenance Facility (OMF). Two locations are in Federal Way and one location is the **Kent Midway Landfill** site. The focus is narrowing on two locations in Federal Way This, to me, is a willful disregard to local area communities when a much more logical alternative exists: use of the **Kent Midway Landfill** site.

The Federal Way locations are detrimental to the local community with regard to housing, business and institution displacement. The resulting disruption serves to negate any positive impact the OMF would have on providing more jobs to the area. Additionally, an OMF at the Federal Way sites would have a detrimental impact to the Hylebos Creek. Building the OMF on the **Kent Midway Landfill** site would eliminate displacement of residents, businesses and institutions further enhancing the OMF's benefits to local communities. Use of the **Kent Midway Landfill** site returns a formerly polluted location to productive use instead of doing environmental harm to another area.

The **Kent Midway Landfill** Superfund Site has been deemed "Site Ready for Reuse and Redevelopment" since 2007. One of the goals of Superfund Cleanup is to return a site to productive use. What better use for this particular site? The eastern perimeter of this site is already being developed for track to be laid for the Federal Way Link Light Rail Extension Project. To use the site to further support our region's transportation infrastructure by choosing it as the South OMF site is a logical next step.

Developing the **Kent Midway Landfill** Superfund site will be more expensive in the short term, but the long term benefits brought about by added OMF jobs without disruption to local communities and their ecosystems is more than worth that cost. To date, you have not indicate any exploration of federal assistance. With the present administration's goal toward reclaiming land, this is myopic in the extreme.

Investing in the South OMF at the Kent Midway Landfill site now is not only the right thing to do, it is a social, economic and ecological imperative.

Sincerely,

[redacted]

Karen Brugato

Comment ID	**Comment Text**	**Response**
1	The Federal Way locations are detrimental to the local community with regard to housing and business displacement. The resulting disruption serves to negate much of the positive impact the OMF would have on providing more jobs to the area. Additionally, an OMF at the Federal Way sites would have a detrimental impact on Hylebos Creek.	Please see the response to Common Comment 3 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	Building the OMF on the Kent Midway Landfill site would eliminate displacement of residents, businesses and institutions further enhancing the OMF's benefits to local communities. Use of the Kent Midway Landfill site returns a formerly polluted location to productive use instead of doing environmental harm to another area.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.

REGION 10
SEATTLE, WA 98101

November 6, 2023

Justin Zweifel, Environmental Protection Specialist
Federal Transit Administration
915 2nd Ave, Suite 3192
Seattle, Washington 98174

Erin Green, South Corridor Environmental Manager
Sound Transit
401 S Jackson Street
Seattle, Washington 98194

Dear Justin Zweifel and Erin Green:

The U.S. Environmental Protection Agency has reviewed Federal Transit Administration's Draft Environmental Impact Statement for the Operations and Maintenance Facility South Project (CEQ number 20230122, EPA Project Number 23-0027-FTA). EPA has conducted its review pursuant to the National Environmental Policy Act and our review authority under Section 309 of the Clean Air Act. The CAA Section 309 role is unique to EPA and requires EPA to review and comment publicly on any proposed federal action subject to NEPA's environmental impact statement requirement. EPA is one of the cooperating agencies on the project and offered its scoping comments and recommendations in August 2023.

The DEIS evaluates the potential environmental impacts with the construction and operation of a light rail facility in south King County. The proposed facility will be used for light rail vehicle storage, inspection, maintenance and repair, cleaning, and testing and commissioning of new light rail vehicles. The DEIS includes a No-Build Alternative and three build alternatives: the South 336th Street Alternative (Preferred Alternative), South 344th Street Alternative, and Midway Landfill (a Superfund site) Alternative. The Preferred Alternative is also identified as the Preferred Alternative in the 2021 State Environmental Policy Act DEIS for this project.

EPA supports the project's plan to expand mobility in the region for transit dependent people, low-income populations, and communities of color. EPA supports the goals to provide regional transit in a manner that preserves and promotes a healthy environment and economy by minimizing adverse impacts on the environment and people through sustainable practices. Regional public transit has an important role in reducing vehicle miles traveled and vehicle emissions in an area with heavy traffic congestion.

In reviewing the DEIS, EPA identified that the proposed action has the potential to disproportionately impact communities with environmental justice concerns, including tribal, minority, and low-income communities, and provides recommendations to address these impacts in the Final EIS, including:

- Consistent with Executive Orders 14096 and 12898, further evaluate and identify communities with EJ concerns who may be impacted by the proposed project. Consider utilizing EPA's EJScreen tool, as well as Washington State Department of Health Environmental Health Disparities map to determine environmental risks to the communities with EJ concerns and implications for the proposed project.
- Continue to meaningfully engage with communities with EJ concerns who may be disproportionately impacted by the project, including adjacent neighborhoods, tribes, and statewide and local organizations.
- Describe the efforts to meaningfully engage these communities when analyzing for disproportionate impacts; developing ways to avoid, mitigate and minimize those impacts; and the outcome of the engagement efforts on the proposed project.
- Mechanisms to assess and address potential air quality impacts from the proposed project on communities with EJ concerns.

The enclosed Detailed Comments provide greater detail of these and other concerns, as well as recommendations for the Final EIS.

Thank you for the opportunity to review the DEIS for this project. If you have questions about this review, please contact Theogene Mbabaliye of my staff at (206) 553-6322 and mbabaliye.theogene@epa.gov, or me, at (206) 553-1774 or at chu.rebecca@epa.gov.

Sincerely,

Rebecca Chu, Chief
Policy and Environmental Review Branch

Enclosure

U.S. EPA Detailed Comments on the
Operations and Maintenance Facility South Project DEIS
King County, Washington
November 2023

Environmental Justice (EJ)
EPA has concerns about the conclusions made in the DEIS regarding EJ impacts and recommends the FEIS identify, analyze, and address disproportionate impacts in accordance with Executive Order 14096, *Revitalizing Our Nation's Commitment to Environmental Justice for All* and the *Guidance from the Council on Environmental Quality on Environmental Justice and the National Policy Act* (CEQ EJ Guidance).[1]

EO 14096 directs federal agencies, as appropriate and consistent with applicable law, to identify, analyze, and address disproportionate and adverse human health and environmental effects (including risks) and hazards of Federal activities, including those related to climate change and cumulative impacts of environmental and other burdens on communities with environmental justice concerns. It builds upon Executive Order 12898 *Federal Action to Address Environmental Justice in Minority Populations and Low-Income Populations.* EO 14096 further states that EPA will carry out responsibilities under Section 309 of the Clean Air Act, 42 U.S.C. 7609, to assess whether each agency analyzes and avoids or mitigates disproportionate human health and environmental effects on communities with EJ concerns.

EPA recommends the EJ topic be analyzed further in Chapter 3 of the Final EIS as its own section, rather than in Appendix E, to highlight the importance of EJ as a part of the affected environment. EPA also offers the following recommendations to fully identify, analyze, and address disproportionate impacts from the proposed project to communities with EJ concerns.

Potential Disproportionate Impacts on Communities with EJ Concerns
The DEIS concludes that "[a]fter considering the project's potential effects, mitigation, and avoidance measures and anticipated benefits to minority and low-income populations, FTA has made a preliminary determination that the OMF South would not result in disproportionately adverse effects on minority and low-income populations."[2] EPA has concerns that the project may have disproportionate impacts and recommends the Final EIS further analyze impacts to communities.

Assessing EPA's Environmental Justice Screening and Mapping Tool (EJScreen) information is a useful first step in understanding or highlighting locations that may be candidates for further review or outreach.[3] EPA considers a project to be in an area of potential EJ concern when an EJScreen for the impacted area shows one or more of the EJ Indexes at or above the 80th percentile in the nation and/or state. We note the DEIS only includes a 0.5-mile radius around the project site to identify communities with EJ concerns. At a minimum, EPA recommends an EJScreen analysis consider EJScreen information for the block groups which contains the proposed action and a one-mile radius around those areas.

---

[1] https://www.epa.gov/sites/default/files/2015-02/documents/ej_guidance_nepa_ceq1297.pdf. Accessed 9/25/2023.
[2] DEIS page 3.6-12.
[3] https://ejscreen.epa.gov/mapper/. Accessed 10/24/2023.

EPA ran EJScreen with a 1-mi buffer around the project area and found that 10 out of the 12, and 11 out of the 12 EJ Indexes exceeded the 80th percentile when compared to the state, for the preferred alternative location and the midway landfill location, respectively. Exceeded EJ indexes include indicators relating to air quality, including diesel particulate matter at the 98th percentile at the preferred location and the 97th percentile for the Midway Landfill location.

EPA also recommends considering the Washington State Department of Health Environmental Health Disparities map.[4] This map depicts cumulative health impact as a ranking from 1 to 10, with 10 indicating the highest impact. These rankings reflect the risk each community faces from multiple environmental hazards and the degree to which a community is more vulnerable to those hazards because of certain sociodemographic factors. Rankings for this map can be interpreted as a way to measure relative environmental risk factors in communities. The project area for all alternatives and the surrounding census tracts all rank at 10.

These screening tools indicate that the proposed project is located within an area with potential EJ concerns and that these communities face significant environmental disparities. EPA has concerns that the cumulative impacts of this project and the historically over-burdened nature of the area could have significant potential disproportionate adverse impacts on communities with EJ concerns.

EPA recommends the Final EIS include a more robust analysis of the project's potential impacts to communities with EJ concerns including but not limited to community cohesion, affordable housing, public health impacts, and public safety. EPA is concerned that the project development will further exacerbate a historically over-burdened community.

Mitigation

The DEIS states that disproportionate impacts will not occur due to identified mitigation measures and community benefits. It is unclear in the DEIS if identified mitigation measures will fully offset the disproportionate impacts from the project, especially considering the prior recommendations related to fully identifying where EJ concerns may occur and be impacted by the proposed project. In addition, the benefits identified are not specific to the impacted communities. Finally, it is unclear if mitigation measures and benefits were identified through robust community involvement (e.g., informed by meaningful engagement with the impacted community).

The CEQ EJ Guidance identifies important ways to consider mitigation for EJ under NEPA, including:

- "Mitigation measures identified as part of . . .an environmental impact statement (EIS), or a record of decision (ROD), should, whenever feasible, address significant and adverse environmental effects of proposed federal actions on minority populations, low-income populations, and Indian tribes."

---

[4] https://doh.wa.gov/data-and-statistical-reports/washington-tracking-network-wtn/washington-environmental-health-disparities-map. Accessed 10/24/2023.

- "Each Federal agency must provide opportunities for effective community participation in the NEPA process, including identifying potential effects and mitigation measures in consultation with affected communities and improving the accessibility of public meetings, crucial documents, and notices."

The DEIS indicates that one of the key benefits to the community would be the generation of 11,200 to 20,000 jobs in the region.[5] EPA recommends the FEIS provide clarification on this benefit to communities with EJ concerns that are impacted by the project, specifically:

- If job training will be provided to communities most impacted,
- Will additional measures to be taken to hire within the impacted communities for these 11,200 to 20,0000 jobs, and
- The types of jobs available to the impacted community (e.g., permanent or temporary; professional or nonprofessional).

If there are no additional tailored mitigation measures to be implemented, provide clarification that the benefit received will be regional job opportunities and are not tailored to the communities with EJ concerns impacted by the proposed project.

EPA recommends developing specific mitigation measures to address the potential disproportionate EJ impacts. In developing mitigation measures, consider mechanisms to minimize impacts of the proposed project to communities. It is important to shape mitigation efforts through engagement with each uniquely impacted group.

An example of a mitigation measure EPA has seen applied in other federal projects to address impacts on communities with EJ concerns is the development of a community benefits agreement (CBA). CBAs have been used to mitigate impacts to displaced communities and those with disrupted community cohesion from displacement of community gathering places like churches. Developing a CBA involves robust community involvement and meaningful engagement to ensure mitigation measures benefit the most impacted communities. Consider neighborhood plans and goals when identifying mitigation measures to help inform mitigation to offset disproportionate impacts. Community benefits may vary from community to community depending on their unique attributes. Consider reviewing previous strategies to develop a CBA such as FHWA's South End Park neighborhood redevelopment project in which community members helped inform innovative mitigation measures.[6]

EPA notes that CEQ's EJ Guidance states that "agencies should recognize the interrelated cultural, social, occupational, historical, or economic factors that may amplify the natural and physical environmental effects of the proposed agency action. These factors should include the physical sensitivity of the community or population to particular impacts; the effect of any disruptions on the community structure associated with the proposed action; and the nature and degree of the impact on the physical and social structure of the community."[7]

---

[5] DEIS page E-25.

[6] https://www.fhwa.dot.gov/environment/environmental_justice/resources/ej_and_nepa/case_studies/case08.cfm. Accessed 10/24/2023.

[7] CEQ EJ Guidance, page 9.

To address these interrelated factors that may amplify the natural and physical environmental effects of the proposed agency action, EPA further recommends the Final EIS include specific information and measures related to compensation and relocation assistance for low-income and minority residences and minority-owned businesses that could be acquired, displaced, and relocated by the project. Include in the Final EIS additional information and measures to address the temporary or long-term loss of services to low-income and minority communities provided by community organizations, such as the Christian Faith Center that has daycare services, that will either be relocated by the project or affected during construction of the project. It will also be important for FTA to discuss in the Final EIS plans to resolve conflicts that could arise from businesses and residents that might refuse easement offers.

Meaningful Public Engagement
In addition to fully characterizing the communities with EJ concerns who may be impacted by the proposed project, EPA recommends conducting meaningful engagement to ensure community feedback is reflected in the decision-making process. EPA appreciates FTA's efforts to inform the public and has recommendations to involve the public more meaningfully to help identify mitigation measures to disproportionate impacts on communities with EJ concerns.

EPA recommends mitigation efforts be guided by meaningful public engagement with impacted communities. CEQ guidance states that "agencies should elicit the views of the affected populations on measures to mitigate a disproportionately high and adverse human health or environmental effect…and should carefully consider community views in developing mitigation strategies."[8]

EO 14096 states [federal agencies are] to "provide opportunities for the meaningful engagement of persons and communities with environmental justice concerns who are potentially affected by Federal activities including by providing timely opportunities for members of the public to share information or concerns and participate in decision-making processes, fully considering public input provided as part of decision-making processes, and providing notice of and engaging in outreach to communities or groups of people who are potentially affected and who are not regular participants in Federal decision-making."

Given the above, EPA recommends:

- Designing robust community engagement practices to maximize participation opportunities for communities that would be affected by the project, such as community-based workshops to facilitate discussion and issue resolution.
- Creating community advisory committees with representatives from impacted communities to help facilitate guidance and feedback from community members.
- Hosting focus group discussions to have robust conversations around mitigation that is appropriate to each impacted community.

EPA has concerns that while efforts have been made to inform the public, the public's feedback has not been fully incorporated into the decision-making process and/or addressed in the NEPA process. EPA recommends the Final EIS include more details on how input from impacted communities is considered in this process, including the selection of the preferred alternative, and ensure that public input is fully considered and responded too in the decision-making process.

---

[8] CEQ EJ Guidance, page 16.

The CEQ EJ Guidance specifies that "[u]nder NEPA, the identification of a disproportionately high and adverse human health or environmental effect on a low-income population, minority population, or Indian tribe does not preclude a proposed agency action from going forward, nor does it necessarily compel a conclusion that a proposed action is environmental unsatisfactory. Rather, the identification of such an effect should heighten agency attention to alternatives (including alternative sites), mitigation strategies, monitoring needs, and preferences expressed by the affected community or population."[9]

Potential Impacts to Air Quality

The DEIS states that, "[a]lthough portions of the Puget Sound region are in maintenance areas for $PM_{2.5}$ and PM_{10}, none of the build alternatives are located within nonattainment or maintenance areas." While this may be true, it is also possible that local air quality may still be impacted due to cumulative impacts from surrounding activities such as road construction and site operations, traffic on unpaved roads and others, including use of woodstoves, agriculture, fire, and air traffic. EJScreen indicates EJ indexes above the 90th percentile for diesel particulate matter, air toxics cancer risk, and air toxics respiratory hazard index at all alternative locations, and above the 80th percentile for particulate matter at the preferred alternative location. This is consistent with the WA Health Disparities Map which ranks diesel exhaust $PM_{2.5}$ emissions at a 9 out of 10 for all locations. Changes in climate may also result in increased air pollution from future wildfires.[10] In our scoping comments for the project in August, EPA had also indicated that evaluation of cumulative impacts on air quality will be important because of this project sites proximity to the Tacoma $PM_{2.5}$ maintenance area.

Because of this project's potential air quality impacts, EPA recommends the Final EIS:

- Estimate air emissions from all sources (e.g., stationary and mobile sources) for the analysis area; discuss the timeframe for release of these emissions; and determine whether the emissions will exceed National Ambient Air Quality Standards (NAAQS). For accurate air emission estimates, use the latest version of EPA's Motor Vehicle Emission Simulator (MOVES3).[11] The DEIS does not currently provide baseline data on air quality to help determine the extent to which the project will impact air quality in the project area and vicinity. EPA recommends an assessment of baseline conditions be conducted and disclosed in the Final EIS, including a summary of representative background concentration of criteria air pollutants and any relevant information regarding local air toxics, if available.
- Expand the fugitive dust plan for the alternative project sites, particularly to identify nearby sensitive receptors and measures to protect these from dust impacts. Describe in the plan how the nearby public will be kept informed of the project and be provided contact methods to report fugitive dust impacts.

---

[9] Council on Environmental Quality. Environmental Justice Guidance Under the National Environmental Policy Act, pg. 10. https://www.epa.gov/sites/default/files/2015-02/documents/ej_guidance_nepa_ceq1297.pdf. Accessed 10/25/2023.

[10] https://19january2017snapshot.epa.gov/sites/production/files/2016-09/documents/climate-change-wa.pdf. Accessed 10/26/2023.

[11] https://www.epa.gov/moves/latest-version-motor-vehicle-emission-simulator-moves. Accessed 10/29/2023.

- Include a summary of the project-related Mobile Source Air Toxics analysis results using the most recent EPA model for analysis of these emissions and related health risks.[12] If there will be significant air toxics emissions, consider giving preference to contractors using highest engine Tier available (Tier 3 or 4) machinery to reduce air toxics emissions during implementation of the project. During project site preparation, the DEIS indicates there will be up to 564 truck trips per day traveling to and from the project site. As this number does not account for the project construction and overall cumulative traffic in the area, it is possible that mobile source air toxics emissions from the project and other surrounding sources could be significant and warrant further analysis.
- Ensure the above analyses include off-site mobile source air emissions of vehicles and trucks along likely corridors to and from the facility from both the construction and operations of the project with respect to criteria air pollutants and air toxics, including diesel particulate matter emissions. Consider sensitive receptors and vulnerable populations such as communities with EJ concerns, park/recreational users, schools, daycares, seniors/nursing homes, hospitals, and other healthcare facilities. The air quality analysis does not currently include health-related risks associated with diesel exhaust emissions. Providing a diesel exhaust emissions analysis of the long-term increased truck traffic and its impact on the surrounding community will be helpful.
- Identify appropriate mitigation measures and best management practices to reduce emissions and comply with federal and state air quality regulations.
- Discuss plans to monitor air quality in the project area and take corrective action if the NAAQS are not met. This is important because there are sensitive receptors in the project area and motor vehicle traffic may increase in the area, particularly during project construction. Localized air quality conditions can be substantial (e.g., during wildfire burns), even though area-wide and/or long-term emissions monitoring may show compliance with NAAQS. Consideration of the cumulative health impacts caused by the project (construction, operation, and maintenance phases) and other sources to communities with EJ concerns will also be important, as well as coordination with public health agencies and industry, which often have data on human health and environmental hazards.
- Clarify whether the project analysis area is adjacent to the maintenance area for $PM_{2.5}$ and discuss when the maintenance period will end or be renewed. If the site is adjacent to this maintenance area and a conformity determination analysis is conducted, then, provide results of such analysis in the Final EIS. It may also be prudent to monitor air locally and take corrective action if NAAQS are exceeded, even if temporarily.
- Provide information on coordination with other entities in the area, such as the State of Washington Departments of Ecology and Social and Health Services and local air organizations, to ensure emissions due to the proposed project are reduced and effectively mitigated throughout the proposed project lifespan.

Potential Impacts to Surface Water Quality and Beneficial Uses

As construction and operation activities may impact water resources, resulting in alterations of local hydrology and long-term impacts to water quality parameters and designated beneficial uses due to increased turbidity and sedimentation of these pollutant receiving waters, EPA recommend that the Final EIS:

---

[12] https://www.epa.gov/AirToxScreen. Accessed 10/29/2023.

- Include information on the most recent EPA-approved Water Quality Standards (WQS) for the State of Washington and implications for water quality protection within waterbodies in the analysis area and vicinity. It would be important for the public to know the State WQS to determine the extent to which the proposed action would impact water quality. The DEIS indicates that Build Alternatives will likely impact two already impaired tributaries on current Washington State's 303(d) list due to exceedances of copper, lead, polycyclic aromatic hydrocarbons (PAHs), pH, and zinc WQS within the West Fork Hylebos tributary; and bacteria, dissolved oxygen in McSorley Creek. Under the Preferred Alternative, there will also be a loss of riparian vegetation which may contribute to long-term impacts to water resources in the project area and downstream areas, including increased stream temperatures; decreased runoff interception and pollutant filtration functions; reduced groundwater recharge; increased erosion and sedimentation; and loss of stream channel stabilization.[13]
- Discuss the project impacts analyses and conclusions based on the most recent WQS information. Where WQS are exceeded, it will be important for the FEIS to discuss how these impaired waterbodies will be restored.
- Provide the most current information regarding the status of the Clean Water Act § 401 certification and **§** 404 permit application processes, as well as conditions to protect water quality and wetlands.
- Include up-to-date information on the anticipated Pollutant Discharge Elimination System (NPDES) permit application process including measures to protect water quality and development of Storm Water Pollution Prevention Plans, reporting, and monitoring. The DEIS indicates that project construction will disturb more than 1 acre of land (up to 68 acres), which will subject the project to NPDES permitting requirements for discharges to waters of the United States and related Stormwater Pollution Prevention Plan and construction best management practices.
- Consider implementation of low impact development techniques, which have the potential to further reduce stormwater volumes and thus mimic natural conditions as closely as possible. The techniques also lessen impacts of stormwater runoff from impervious surfaces such as paved roads, parking lots, and roofs and can provide energy and other utility savings.
- Describe plans to coordinate with the Washington State Department of Ecology and all affected tribes to assure that state and tribal water resources are protected from impacts associated with the proposed project's construction, operation, and maintenance activities.

The DEIS indicates that water quality may be adversely affected if the project construction activities (excavation, digging, bulldozing, surface pavement, earthwork and grading, stream relocation, etc.) alter the hydrology of springs and surface runoff such that erosion carries sediment to surface waters and pollutants to local drainages and the underlying aquifer. In addition, land disturbance, material storage, waste disposal, inadvertent chemical or hazardous liquid spills, and compaction produced by vehicular traffic can all affect recharge to the local aquifer and groundwater quality. The Build

---

[13] DEIS, p. 3.11-12.

Alternatives may also result in unavoidable permanent direct, indirect, and temporary impacts to wetlands and their buffers.

Potential Impacts on Contaminated Sites and Monitoring

If the FTA and Sound Transit reconsider the Midway Landfill Alternative, EPA recommends FTA coordinate with EPA R10 Superfund Program as the project is implemented so that project activities are consistent with agreed upon remedies for the Midway Landfill Superfund site. The EPA Remedial Program Manager is Ashley Grompe, and she may be reached at (206) 553-1284 or grompe.ashley@epa.gov. It will also be helpful to coordinate with Washington State Department of Ecology so that the FEIS identifies all the contaminated sites in the planning area and vicinity and discusses measures to take to minimize project impacts and meet state requirements.

The DEIS identifies several existing contaminated sites in the project area (up to 64 sites), and the possibility that more contaminated sites could be discovered during construction and operation of the project. Identification of the sites was also limited to a 1/8-mile radius, which is less than the suggested 1-mile radius used for identification of contaminated sites.[14]

Potential Impacts to Biological Resources

We recommend that the Final EIS include information on working with the U.S. Fish and Wildlife Service and National Marine Fisheries Service, and, as appropriate, with the Washington Department of Fish and Wildlife, including recommended measures to reduce risks and protect biota and habitat. The DEIS indicates the proposed project activities may impact federally and state protected species occurring in the project area and vicinity, such as the threatened Puget Sound Chinook salmon, Puget Sound steelhead, and bull trout. Because of their potential to support fish use, the East and West Fork Hylebos tributaries in the project area are also designated as essential fish habitat for Pacific salmon.

The impacts to biological resources will be due to the anticipated loss and degradation of suitable habitats and cover; increased sediment delivery to streams, resulting in increased turbidity; and higher than optimal noise levels during project construction activities that will involve use of excavators and other heavy equipment or machinery. EPA also encourages the FTA to include in the FEIS information on the outcomes of consultations with the Services and coordination with the state agency.

Coordination with Tribes

EPA encourages FTA to incorporate feedback from Tribes when making decisions regarding the project and recommends the FEIS describe the issues raised during government-to-government consultations and how those issues were addressed.

Monitoring of the Project and Adaptive Management

EPA recommends the FEIS include a monitoring program designed to assess both impacts from activities and effectiveness of mitigation measures for the impacts and indicate how the program will use an effective feedback mechanism, such as adaptive management, so that any needed adjustments can be made to the activities to meet environmental objectives during project implementation. For example, there could be a plan to monitor noise impacts during project construction and take corrective action if noise complaints or damage claims exceed existing levels.

---

[14] https://wsdot.wa.gov/sites/default/files/2021-10/Env-HazMat-ERSECSGuidance.pdf. Accessed 10/30/2023.

Social Cost of Greenhouse Gases

EPA acknowledges the DEIS quantifies the greenhouse gas emissions for operations, maintenance, and construction, including haul truck emissions, for the proposed alternatives. EPA continues to recommend the FEIS estimate the social cost of GHG emissions (SC-GHG) for each alternative to facilitate decisionmakers' and the public's evaluation of the proposed alternatives by monetizing the calculated GHG emissions. This is in alignment with CEQ's January 9, 2023 interim guidance to assist federal agencies in assessing and disclosing climate change impacts during environmental reviews.[15] This guidance was in response to EO 13990, *Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis*.[16] Alternatively, if choosing to not include SC-GHG in the analysis, provide a basis for that decision.

EPA (Communication ID 539079)		
Comment ID	**Comment Text**	**Response**
1	**Environmental Justice (EJ)** EPA has concerns about the conclusions made in the DEIS regarding EJ impacts and recommends the FEIS identify, analyze, and address disproportionate impacts in accordance with Executive Order 14096, Revitalizing Our Nation's Commitment to Environmental Justice for All and the Guidance from the Council on Environmental Quality on Environmental Justice and the National Policy Act (CEQ EJ Guidance). EO 14096 directs federal agencies, as appropriate and consistent with applicable law, to identify, analyze, and address disproportionate and adverse human health and environmental effects (including risks) and hazards of Federal activities, including those related to climate change and cumulative impacts of environmental and other burdens on communities with environmental justice concerns. It builds upon Executive Order 12898 Federal Action to Address Environmental Justice in Minority Populations and Low-Income Populations. EO 14096 further states that EPA will carry out responsibilities under Section 309 of the Clean Air Act, 42 U.S.C. 7609, to assess whether each agency analyzes and avoids or mitigates disproportionate human health and environmental effects on communities with EJ concerns.	FTA recognizes EPA's oversight responsibilities under Executive Order (EO) 14096, Revitalizing Our Nation's Commitment to Environmental Justice for All, which was enacted on April 21, 2023. EO 14096 does not rescind EO 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, which has been in effect since February 11, 1994, and is currently implemented through DOT Order 5610.2C. FTA continues this implementation for all projects, including OMF South, until further guidance is provided regarding the implementation of EO 14096 on environmental justice. This has been clarified in Appendix E, Environmental Justice Assessment, of the Final EIS.
2	EPA recommends the EJ topic be analyzed further in Chapter 3 of the Final EIS as its own section, rather than in Appendix E, to highlight the importance of EJ as a part of the affected environment. EPA also offers the following recommendations to fully identify, analyze, and address disproportionate impacts from the proposed project to communities with EJ concerns.	A summary of the Environmental Justice Assessment is included in Section 3.6, Environmental Justice, Social Resources, Community Facilities, and Neighborhoods, in the Final EIS. This section was renamed between the publication of the 2023 Draft EIS and the Final EIS to include "Environmental Justice" in the title. Additionally, an environmental justice summary is included in the Executive Summary of the Draft and Final EIS.
3	***Potential Disproportionate Impacts on Communities with EJ Concerns*** The DEIS concludes that "[a]fter considering the project's potential effects, mitigation, and avoidance measures and anticipated benefits to minority and low-income populations, FTA has made a preliminary determination that the OMF South would not result in disproportionately adverse effects on minority and low-income populations." EPA has concerns that the project may have disproportionate impacts and recommends the Final EIS further analyze impacts to communities.	Based on EPA's comments, FTA and Sound Transit conducted additional analysis on potential impacts to minority and low-income populations. This has included evaluating potential impacts at the block group level and evaluating potential cumulative impacts using the EJScreen tool. FTA and Sound Transit also expanded the discussion on the project mitigation and benefits. These updates are reflected in Appendix E, Environmental Justice Assessment, of the Final EIS. After consideration of the additional analysis, FTA maintains the preliminary determination that OMF South would not result in disproportionately adverse effects on environmental justice populations.
4	Assessing EPA's Environmental Justice Screening and Mapping Tool (EJScreen) information is a useful first step in understanding or highlighting locations that may be candidates	Appendix E, Environmental Justice Assessment, of the Final EIS uses census data to characterize the study area consistent with FTA's guidance. This is

EPA (Communication ID 539079)		
Comment ID	**Comment Text**	**Response**
	for further review or outreach. EPA considers a project to be in an area of potential EJ concern when an EJScreen for the impacted area shows one or more of the EJ Indexes at or above the 80th percentile in the nation and/or state. We note the DEIS only includes a 0.5-mile radius around the project site to identify communities with EJ concerns. At a minimum, EPA recommends an EJScreen analysis consider EJScreen information for the block groups which contains the proposed action and a one-mile radius around those areas. EPA ran EJScreen with a 1-mi buffer around the project area and found that 10 out of the 12, and 11 out of the 12 EJ Indexes exceeded the 80th percentile when compared to the state, for the preferred alternative location and the midway landfill location, respectively. Exceeded EJ indexes include indicators relating to air quality, including diesel particulate matter at the 98th percentile at the preferred location and the 97th percentile for the Midway Landfill location.	the same census data used by EJScreen and results in a similar characterization of EJ populations. Sound Transit updated Appendix E, Environmental Justice Assessment of the Final EIS to reflect the EJScreen outputs in Section 5.3, Cumulative Impacts, and Attachment A, EJ Screen Reports. The 0.5-mile study area was used because it captures (1) the area of potential direct and indirect impacts from project construction and operation and (2) the demographic characteristics of the population that is most likely to experience impacts of the project. For example, a larger study area of 1.0 mile would reduce the percent of low-income and minority populations and include populations that would not be as directly affected by the project. This approach is consistent with FTA's Circular C-4703.1, Environmental Justice Policy Guidance for Federal Transit Administration Recipients, that states, "The boundaries of your unit of geographic analysis should be large enough to include the area likely to experience adverse effects, but not so large as to artificially dilute the minority population and/or low-income population." Appendix E Section 2.1, Study Area, has been updated to provide additional information on why a 0.5-mile study area is used.
5	EPA also recommends considering the Washington State Department of Health Environmental Health Disparities map. This map depicts cumulative health impact as a ranking from 1 to 10, with 10 indicating the highest impact. These rankings reflect the risk each community faces from multiple environmental hazards and the degree to which a community is more vulnerable to those hazards because of certain sociodemographic factors. Rankings for this map can be interpreted as a way to measure relative environmental risk factors in communities. The project area for all alternatives and the surrounding census tracts all rank at 10.	Appendix E, Environmental Justice Assessment, of the Final EIS has been updated to include a summary of Washington Department of Health Environmental Health Disparities map data. This provides an additional level of information about the affected environment and existing conditions but does not change the impact analysis because the project is not anticipated to compound issues identified by the Disparities Map.
6	These screening tools indicate that the proposed project is located within an area with potential EJ concerns and that these communities face significant environmental disparities. EPA has concerns that the cumulative impacts of this project and the historically over-burdened nature of the area could have significant potential disproportionate adverse impacts on communities with EJ concerns. EPA recommends the Final EIS include a more robust analysis of the project's potential impacts to communities with EJ concerns including but not limited to community cohesion, affordable housing, public health impacts, and public safety. EPA is concerned that the project development will further exacerbate a historically over-burdened community.	Section 5.3, Cumulative Impacts, of Final EIS Appendix E, Environmental Justice Assessment, has been updated to include consideration of the EJScreen tool outputs. It identifies that the project study area is in the 80th and 90th percentiles for many of the environmental indexes when compared to national and state data. One of the EJScreen indexes is Superfund proximity. The Midway Landfill Alternative would affect a Superfund site. As described in Section 3.13, Hazardous Materials, of the Final EIS, Sound Transit would coordinate with EPA and Ecology to identify and implement appropriate mitigation measures. The project would not have adverse impacts related to other EJScreen indexes.

	Comment Text	Response
		The Environmental Justice Assessment also evaluates potential impacts to environmental justice populations for all elements of the environment, including community cohesion, affordable housing, public health, and public safety. Potential impacts to community cohesion and affordable housing, public health, and public safety are also described in more detail in Section 3.6, Environmental Justice, Social Resources, Community Facilities, and Neighborhoods; Section 3.8, Air Quality and Greenhouse Gases; Section 3.13, Hazardous Materials; and Section 3.14, Public Services, of the Final EIS. With implementation of best management practices and mitigation for hazardous materials related to the Midway Landfill Alternative, no adverse impacts are identified for these elements of the environment.
7	***Mitigation*** The DEIS states that disproportionate impacts will not occur due to identified mitigation measures and community benefits. It is unclear in the DEIS if identified mitigation measures will fully offset the disproportionate impacts from the project, especially considering the prior recommendations related to fully identifying where EJ concerns may occur and be impacted by the proposed project. In addition, the benefits identified are not specific to the impacted communities. Finally, it is unclear if mitigation measures and benefits were identified through robust community involvement (e.g., informed by meaningful engagement with the impacted community). The CEQ EJ Guidance identifies important ways to consider mitigation for EJ under NEPA, including: • “Mitigation measures identified as part of ... an environmental impact statement (EIS), or a record of decision (ROD), should, whenever feasible, address significant and adverse environmental effects of proposed federal actions on minority populations, low-income populations, and Indian tribes.” • “Each Federal agency must provide opportunities for effective community participation in the NEPA process, including identifying potential effects and mitigation measures in consultation with affected communities and improving the accessibility of public meetings, crucial documents, and notices.”	Sound Transit has updated Appendix E, Environmental Justice Assessment, of the Final EIS to include additional information on project mitigation and benefits. Impacts to environmental justice populations would be mitigated with the exception of visual impacts from the Preferred and South 344th Street alternatives. The project would also provide direct and indirect benefits. Direct benefits include: • Enhanced community connectivity for the Preferred Alternative through public space and a multi-use trail integrated into the site design that would benefit the surrounding community • Construction jobs with project labor agreements and a DBE program to support hiring of minority populations • Creation of new jobs to operate the facility that could benefit both environmental justice and non-environmental justice populations Indirect benefits include supporting the Sound Transit 3 system expansion by providing capacity to ensure transit reliability, access, connectivity, and frequency. Sound Transit and FTA have completed robust community engagement for the project. Engagement methods included online and in-person outreach, existing community efforts, media advertisements, English and translated materials (in Spanish, Korean, and Russian), and additional outreach efforts to ensure continual engagement and availability of information throughout Early Scoping, Scoping, 2021 SEPA Draft EIS publication, and 2023 NEPA Draft/SEPA Supplemental Draft EIS publication. Public input on proposed mitigation measures was solicited through the community engagement for the 2021 and 2023 Draft EIS publications.

EPA (Communication ID 539079)		
Comment ID	**Comment Text**	**Response**
		Appendix E, Environmental Justice Assessment, of the Final EIS was also updated to reflect the community engagement activities that occurred as part of the 2023 Draft EIS publication. Additional information on this engagement is described in Appendix B, Public Involvement and Agency Coordination, of the Final EIS.
8	The DEIS indicates that one of the key benefits to the community would be the generation of 11,200 to 20,000 jobs in the region. EPA recommends the FEIS provide clarification on this benefit to communities with EJ concerns that are impacted by the project, specifically: • If job training will be provided to communities most impacted, • Will additional measures to be taken to hire within the impacted communities for these 11,200 to 20,0000 jobs, and • The types of jobs available to the impacted community (e.g., permanent or temporary; professional or nonprofessional). If there are no additional tailored mitigation measures to be implemented, provide clarification that the benefit received will be regional job opportunities and are not tailored to the communities with EJ concerns impacted by the proposed project.	Section 3.5, Economics, of the Final EIS has been updated to provide additional information on the direct and indirect economic output generated by the project. Direct employment generated by construction of OMF South would equate to between approximately 5,600 and 12,000 job years (defined as full-time employment for one person over the course of a year), depending on alternative. Final EIS Appendix E, Environmental Justice Assessment, clarifies that OMF South would result in approximately 610 permanent high-skilled, living wage jobs and that Sound Transit would implement Project Labor Agreements and a Disadvantaged Business Enterprise Program that are targeted to benefit minority or low-income populations and promote a local workforce. Sound Transit acknowledges that the potential for jobs may or may not benefit the affected EJ population of the project or within the study area.
9	EPA recommends developing specific mitigation measures to address the potential disproportionate EJ impacts. In developing mitigation measures, consider mechanisms to minimize impacts of the proposed project to communities. It is important to shape mitigation efforts through engagement with each uniquely impacted group. An example of a mitigation measure EPA has seen applied in other federal projects to address impacts on communities with EJ concerns is the development of a community benefits agreement (CBA). CBAs have been used to mitigate impacts to displaced communities and those with disrupted community cohesion from displacement of community gathering places like churches. Developing a CBA involves robust community involvement and meaningful engagement to ensure mitigation measures benefit the most impacted communities. Consider neighborhood plans and goals when identifying mitigation measures to help inform mitigation to offset disproportionate impacts. Community benefits may vary from community to community depending on their unique attributes. Consider reviewing previous strategies to develop a CBA such as FHWA's South End Park neighborhood redevelopment project in which community members helped inform innovative mitigation measures.	Appendix E, Environmental Justice Assessment, of the Final EIS has been updated to provide more detail on the mitigation proposed for project impacts. This includes more robust information on the relocation assistance Sound Transit would provide to displaced residents and businesses. With the exception of visual impacts, all impacts would be mitigated. The analysis has also been updated to provide more information on project benefits. Throughout the OMF South project, Sound Transit has engaged with the affected community. This is documented in the Final EIS in Appendix B, Public Involvement and Agency Coordination, and summarized in Appendix E, Environmental Justice Assessment. Public input on proposed mitigation measures was solicited through the community engagement and public comment processes for the 2021 and 2023 Draft EIS publications. No substantive comments on the proposed mitigation measures were received. Information on impacts and potential mitigation for the project was also shared with property owners and residents throughout the EIS process.

EPA (Communication ID 539079)		
Comment ID	**Comment Text**	**Response**
10	EPA notes that CEQ's EJ Guidance states that "agencies should recognize the interrelated cultural, social, occupational, historical, or economic factors that may amplify the natural and physical environmental effects of the proposed agency action. These factors should include the physical sensitivity of the community or population to particular impacts; the effect of any disruptions on the community structure associated with the proposed action; and the nature and degree of the impact on the physical and social structure of the community." To address these interrelated factors that may amplify the natural and physical environmental effects of the proposed agency action, EPA further recommends the Final EIS include specific information and measures related to compensation and relocation assistance for low-income and minority residences and minority-owned businesses that could be acquired, displaced, and relocated by the project. Include in the Final EIS additional information and measures to address the temporary or long-term loss of services to low-income and minority communities provided by community organizations, such as the Christian Faith Center that has daycare services, that will either be relocated by the project or affected during construction of the project. It will also be important for FTA to discuss in the Final EIS plans to resolve conflicts that could arise from businesses and residents that might refuse easement offers.	Section 5.1.1.2 in Appendix E, Environmental Justice Assessment, of the Final EIS has been updated to provide more detailed information on the compensation and relocation assistance that would be provided to residents, businesses, and community facilities that would be displaced by the project. It describes Sound Transit's relocation program, which ensures that all persons displaced by the project are treated consistently and equitably and that Sound Transit tailors the relocation to meet residents' specific needs. It also describes the additional considerations that are taken into account for low-income residents who rent.
11	***Meaningful Public Engagement*** In addition to fully characterizing the communities with EJ concerns who may be impacted by the proposed project, EPA recommends conducting meaningful engagement to ensure community feedback is reflected in the decision-making process. EPA appreciates FTA's efforts to inform the public and has recommendations to involve the public more meaningfully to help identify mitigation measures to disproportionate impacts on communities with EJ concerns. EPA recommends mitigation efforts be guided by meaningful public engagement with impacted communities. CEQ guidance states that "agencies should elicit the views of the affected populations on measures to mitigate a disproportionately high and adverse human health or environmental effect…and should carefully consider community views in developing mitigation strategies." EO 14096 states [federal agencies are] to "provide opportunities for the meaningful engagement of persons and communities with environmental justice concerns who are potentially affected by Federal activities including by providing timely opportunities for members of the public to share information or concerns and participate in decision-making processes, fully considering public input provided as part of decision-making processes, and providing notice of and engaging in outreach to communities or groups of people who are potentially affected and who are not regular participants in Federal decision-making." Given the above, EPA recommends:	Sound Transit and FTA have completed robust community engagement with property owners and residents that could be affected by the project, including those in Belmor. Engagement methods included online and in-person outreach, existing community efforts, media advertisements, English and translated materials (in Spanish, Korean, and Russian), and additional outreach efforts to ensure continual engagement and availability of information throughout Early Scoping, Scoping, 2021 SEPA Draft EIS publication, and 2023 NEPA Draft/SEPA Supplemental Draft EIS publication. Public input on proposed mitigation measures was solicited through the community engagement for the 2021 and 2023 Draft EIS publications. Additional information on this engagement is described in Appendix B, Public Involvement and Agency Coordination, of the Final EIS. An example of the meaningful engagement includes changes in the Preferred Alternative design to address comments from the 2021 Draft EIS. As part of the ongoing community and agency coordination, Sound Transit received comments from Federal Way on the 2021 Draft EIS identifying the need to replace 20th Avenue S and concerns from the community about ecosystem impacts of the project. In response to those comments, Sound Transit collaborated with city staff to modify the site design of the Preferred Alternative to replace 20th Avenue S with 18th Place S. Sound Transit also

EPA (Communication ID 539079)		
Comment ID	**Comment Text**	**Response**
	- Designing robust community engagement practices to maximize participation opportunities for communities that would be affected by the project, such as community-based workshops to facilitate discussion and issue resolution. - Creating community advisory committees with representatives from impacted communities to help facilitate guidance and feedback from community members. - Hosting focus group discussions to have robust conversations around mitigation that is appropriate to each impacted community. EPA has concerns that while efforts have been made to inform the public, the public's feedback has not been fully incorporated into the decision-making process and/or addressed in the NEPA process. EPA recommends the Final EIS include more details on how input from impacted communities is considered in this process, including the selection of the preferred alternative, and ensure that public input is fully considered and responded too in the decision-making process. The CEQ EJ Guidance specifies that "[u]nder NEPA, the identification of a disproportionately high and adverse human health or environmental effect on a low-income population, minority population, or Indian tribe does not preclude a proposed agency action from going forward, nor does it necessarily compel a conclusion that a proposed action is environmental unsatisfactory. Rather, the identification of such an effect should heighten agency attention to alternatives (including alternative sites), mitigation strategies, monitoring needs, and preferences expressed by the affected community or population."	modified the design for the Preferred Alternative to allow for a wider stream corridor on the east side of the site, reduce wetland impacts on the west side of the site, and daylight additional stream segments. As the project moves into final design, Sound Transit will continue to engage with Federal Way and the community on design elements of the facility to address visual and community impacts.
12	**Potential Impacts to Air Quality** The DEIS states that, "[a]lthough portions of the Puget Sound region are in maintenance areas for $PM_{2.5}$ and PM_{10}, none of the build alternatives are located within nonattainment or maintenance areas." While this may be true, it is also possible that local air quality may still be impacted due to cumulative impacts from surrounding activities such as road construction and site operations, traffic on unpaved roads and others, including use of woodstoves, agriculture, fire, and air traffic. EJScreen indicates EJ indexes above the 90th percentile for diesel particulate matter, air toxics cancer risk, and air toxics respiratory hazard index at all alternative locations, and above the 80th percentile for particulate matter at the preferred alternative location. This is consistent with the WA Health Disparities Map which ranks diesel exhaust $PM_{2.5}$ emissions at a 9 out of 10 for all locations. Changes in climate may also result in increased air pollution from future wildfires. In our scoping comments for the project in August, EPA had also indicated that evaluation of cumulative impacts on air quality will be important because of this project site's proximity to the Tacoma $PM_{2.5}$ maintenance area.	The cumulative impacts analysis for Air Quality in Chapter 4, Cumulative Effects Analysis of the Final EIS, concludes that, while there is a potential for construction schedules to overlap with other projects in the area, the temporary nature of air quality construction impacts and the use of standard construction best management practices make it unlikely that air quality standards would be exceeded. Section 3.8, Air Quality and Greenhouse Gas Emissions has been updated to include more detail about existing air quality conditions in the study area from the EJScreen and the Washington Environmental Health Disparities Map, as well as from Puget Sound Clean Air Authority (PSCAA) monitoring data. There are no anticipated cumulative impacts expected from the Tacoma $PM_{2.5}$ maintenance area because it is over 2 miles south of the OMF South alternative project sites. Section 3.8, Air Quality and Greenhouse Gas Emissions, of the Final EIS has been revised to include a discussion of a fugitive dust plan, sensitive receptors near the project sites, and

EPA (Communication ID 539079)		
Comment ID	**Comment Text**	**Response**
		estimated construction durations of each build alternative.
13	Because of this project's potential air quality impacts, EPA recommends the Final EIS: • Estimate air emissions from all sources (e.g., stationary and mobile sources) for the analysis area; discuss the timeframe for release of these emissions; and determine whether the emissions will exceed National Ambient Air Quality Standards (NAAQS). For accurate air emission estimates, use the latest version of EPA's Motor Vehicle Emission Simulator (MOVES3).The DEIS does not currently provide baseline data on air quality to help determine the extent to which the project will impact air quality in the project area and vicinity. EPA recommends an assessment of baseline conditions be conducted and disclosed in the Final EIS, including a summary of representative background concentration of criteria air pollutants and any relevant information regarding local air toxics, if available.	Section 3.8, Air Quality and Greenhouse Gas Emissions, of the Final EIS has been revised to include more detail on the types of operational emissions that would be expected and their relative location on the sites. Through coordination with EPA Air Quality staff, EPA affirmed that a MOVES analysis for this project is not warranted because the number of daily trips generated by OMF South is relatively low. As stated in the Final EIS, the project alternatives are in areas that are in attainment for current NAAQS. While $PM_{2.5}$ is a recognized concern throughout the PSCAA region, it is not on the verge of falling into nonattainment. Section 3.8, Air Quality and Greenhouse Gas Emissions, has been updated to include more detail about existing air quality conditions in the study area from the EJScreen and the Washington Environmental Health Disparities Map, as well as from PSCAA monitoring data. According to PSCAA air quality data, diesel emissions (measured as black carbon) have been trending downward, and $PM_{2.5}$ levels have met standards, though wildfire smoke days have posed a concern in recent years. The Final EIS concludes that operational impacts to air quality would be very minor, and while construction-related impacts could affect air quality within localized areas of construction activity (including traffic congestion), those impacts could be avoided or reduced through the use of BMPs. Similarly, the cumulative impacts analysis did not identify any substantial adverse impacts, even with consideration of other construction projects in the vicinity of the site alternatives. In addition, Sound Transit has a robust community outreach program designed to keep the public informed of the project and a lead ombudsman to respond to and address community concerns and questions throughout construction.
14	• Expand the fugitive dust plan for the alternative project sites, particularly to identify nearby sensitive receptors and measures to protect these from dust impacts. Describe in the plan how the nearby public will be kept informed of the project and be provided contact methods to report fugitive dust impacts.	Avoidance and minimization measures have been updated in Section 3.8, Air Quality and Greenhouse Gas Emissions, to add specific measures that could be included in a fugitive dust plan. The contractor will be responsible for preparing and following a fugitive dust plan that will identify corrective actions to be taken if dust from the project site reaches unacceptable levels.

EPA (Communication ID 539079)		
Comment ID	**Comment Text**	**Response**
15	• Include a summary of the project-related Mobile Source Air Toxics analysis results using the most recent EPA model for analysis of these emissions and related health risks. If there will be significant air toxics emissions, consider giving preference to contractors using highest engine Tier available (Tier 3 or 4) machinery to reduce air toxics emissions during implementation of the project. During project site preparation, the DEIS indicates there will be up to 564 truck trips per day traveling to and from the project site. As this number does not account for the project construction and overall cumulative traffic in the area, it is possible that mobile source air toxics emissions from the project and other surrounding sources could be significant and warrant further analysis. • Ensure the above analyses include off-site mobile source air emissions of vehicles and trucks along likely corridors to and from the facility from both the construction and operations of the project with respect to criteria air pollutants and air toxics, including diesel particulate matter emissions. Consider sensitive receptors and vulnerable populations such as communities with EJ concerns, park/recreational users, schools, daycares, seniors/nursing homes, hospitals, and other healthcare facilities. The air quality analysis does not currently include health-related risks associated with diesel exhaust emissions. Providing a diesel exhaust emissions analysis of the long-term increased truck traffic and its impact on the surrounding community will be helpful.	OMF South does not meet the threshold for conducting a Mobile Source Air Toxics (MSAT) analysis. According to FHWA guidance, projects that should complete MSAT analysis include those that have potential for a meaningful difference in MSAT emissions, such as major intermodal freight facilities or projects that would add significant capacity to highways or roads with average annual daily traffic volumes of 140,000 to 150,000 vehicles per day. The OMF South project does not affect any roadways with such traffic volumes, nor would it add capacity to any highways or roads. Through coordination with EPA Air Quality staff, EPA affirmed that MSAT for this project is not warranted.
16	• Identify appropriate mitigation measures and best management practices to reduce emissions and comply with federal and state air quality regulations.	Section 3.8, Air Quality and Greenhouse Gas Emissions, of the Final EIS lists the avoidance and minimization measures, including best management practices to reduce emissions and comply with federal and state air quality regulations. With implementation and consistent use of BMPs to minimize on-site emissions, construction and operation of the proposed project would not be expected to substantially affect air quality, and therefore no mitigation is anticipated.
17	• Discuss plans to monitor air quality in the project area and take corrective action if the NAAQS are not met. This is important because there are sensitive receptors in the project area and motor vehicle traffic may increase in the area, particularly during project construction. Localized air quality conditions can be substantial (e.g., during wildfire burns), even though area-wide and/or long-term emissions monitoring may show compliance with NAAQS. Consideration of the cumulative health impacts caused by the project (construction, operation, and maintenance phases) and other sources to communities with EJ concerns will also be important, as well as coordination with public health agencies and industry, which often have data on human health and environmental hazards.	Section 3.8, Air Quality and Greenhouse Gas Emissions, of the Final EIS found no indication that constructing or operating OMF South would lead to NAAQS exceedances; therefore, no monitoring is proposed. The contractor will be responsible for preparing and following a fugitive dust plan that will identify corrective actions to be taken if dust from the project site reaches unacceptable levels.

EPA (Communication ID 539079)

Comment ID	Comment Text	Response
18	• Clarify whether the project analysis area is adjacent to the maintenance area for $PM_{2.5}$ and discuss when the maintenance period will end or be renewed. If the site is adjacent to this maintenance area and a conformity determination analysis is conducted, then, provide results of such analysis in the Final EIS. It may also be prudent to monitor air locally and take corrective action if NAAQS are exceeded, even if temporarily.	The project alternatives are over 2 miles north of the $PM_{2.5}$ maintenance area in Tacoma/Pierce County (the maintenance area ends at the county line), which will end in March 2035. Accordingly, FTA and Sound Transit determined that a conformity determination analysis is not required for the project, as described in Section 3.8, Air Quality and Greenhouse Gas Emissions, of the Final EIS.
19	• Provide information on coordination with other entities in the area, such as the State of Washington Departments of Ecology and Social and Health Services and local air organizations, to ensure emissions due to the proposed project are reduced and effectively mitigated throughout the proposed project lifespan.	The project did not consult with other agencies over air quality concerns because no air quality impacts were identified beyond short-term construction impacts that can be mitigated through BMPs.
20	**Potential Impacts to Surface Water Quality and Beneficial Uses** As construction and operation activities may impact water resources, resulting in alterations of local hydrology and long-term impacts to water quality parameters and designated beneficial uses due to increased turbidity and sedimentation of these pollutant receiving waters, EPA recommend that the Final EIS: • Include information on the most recent EPA-approved Water Quality Standards (WQS) for the State of Washington and implications for water quality protection within waterbodies in the analysis area and vicinity. It would be important for the public to know the State WQS to determine the extent to which the proposed action would impact water quality. The DEIS indicates that Build Alternatives will likely impact two already impaired tributaries on current Washington State’s 303(d) list due to exceedances of copper, lead, polycyclic aromatic hydrocarbons (PAHs), pH, and zinc WQS within the West Fork Hylebos tributary; and bacteria, dissolved oxygen in McSorley Creek. Under the Preferred Alternative, there will also be a loss of riparian vegetation which may contribute to long-term impacts to water resources in the project area and downstream areas, including increased stream temperatures; decreased runoff interception and pollutant filtration functions; reduced groundwater recharge; increased erosion and sedimentation; and loss of stream channel stabilization. • Discuss the project impacts analyses and conclusions based on the most recent WQS information. Where WQS are exceeded, it will be important for the FEIS to discuss how these impaired waterbodies will be restored.	The project will comply with current stormwater and water quality regulations in effect at the time of construction. As detailed in Section 3.11, Water Resources, these regulations concern stormwater flow control and treatment in order to protect receiving waterbodies. Section 3.11 lists the specific avoidance and minimization measures that the project would implement to protect water quality during construction and operation. Section 3.10, Ecosystems, details avoidance, minimization, and mitigation measures for impacts related to the removal of riparian vegetation. The EIS acknowledges that contamination can bypass stormwater treatment facilities in some instances and that Ecology has evaluated the effectiveness of stormwater facilities in providing treatment that prevents or reduces the toxicity of contaminants in receiving waters. Under any of the build alternatives, treatment effectiveness would be a key consideration in the selection and design of stormwater management facilities. The Final EIS was updated to include a list of regulations that govern the protection or use of water resources in the study area, including the most recent EPA-approved Water Quality Standards (WQS) for the State of Washington. See Appendix H5, Water Resources Technical Appendix. In 2022, EPA approved the 2018 water quality standards for Washington state, which are the most current standards. No WQS exceedances are anticipated as a result of the project.
21	• Provide the most current information regarding the status of the Clean Water Act § 401 certification and § 404 permit application processes, as well as conditions to protect water quality and wetlands.	The need for a Clean Water Act (CWA) Section 401 certification and 404 permit is listed in the Anticipated or Potential Licenses, Permits, and Approvals table in the Fact Sheet of the 2023 Draft EIS and Final EIS. Section 3.10, Ecosystems, and Section 3.11, Water Resources of the 2023 Draft

EPA (Communication ID 539079)		
Comment ID	**Comment Text**	**Response**
		EIS and Final EIS discuss the need to protect water quality and wetlands. Actual permit conditions will be determined through the permit application processes with Ecology and the U.S. Army Corps of Engineers. No permit applications under the CWA have been made to date; these will occur after publication of the Final EIS and once the Sound Transit Board selects the project to be built.
22	• Include up-to-date information on the anticipated Pollutant Discharge Elimination System (NPDES) permit application process including measures to protect water quality and development of Storm Water Pollution Prevention Plans, reporting, and monitoring. The DEIS indicates that project construction will disturb more than 1 acre of land (up to 68 acres), which will subject the project to NPDES permitting requirements for discharges to waters of the United States and related Stormwater Pollution Prevention Plan and construction best management practices.	The need for a compliance review by the local jurisdiction of the NPDES stormwater discharge requirements before discharge to the local stormwater system is listed in the Anticipated or Potential Licenses, Permits, and Approvals table in the Fact Sheet of the 2023 Draft EIS and Final EIS. Section 3.11, Water Resources, of the 2023 Draft EIS and Final EIS lists the potential avoidance and minimization measures and BMPs that could be used during construction, including the development of a Stormwater Pollution Prevention Plan.
23	• Consider implementation of low impact development techniques, which have the potential to further reduce stormwater volumes and thus mimic natural conditions as closely as possible. The techniques also lessen impacts of stormwater runoff from impervious surfaces such as paved roads, parking lots, and roofs and can provide energy and other utility savings.	Low-impact development measures will be considered as part of final design and were discussed in the avoidance and minimization measures listed in Section 3.11, Water Resources, of the 2023 Draft EIS.
24	• Describe plans to coordinate with the Washington State Department of Ecology and all affected tribes to assure that state and tribal water resources are protected from impacts associated with the proposed project's construction, operation, and maintenance activities.	Appendix B, Public Involvement and Agency Coordination, of the Final EIS describes Sound Transit's coordination efforts with regulatory agencies and Tribal governments, including Ecology, throughout the course of the project. Sound Transit will continue coordinating with the Tribes and regulatory agencies throughout the final environmental review, permitting, design, and construction of the project.
25	The DEIS indicates that water quality may be adversely affected if the project construction activities (excavation, digging, bulldozing, surface pavement, earthwork and grading, stream relocation, etc.) alter the hydrology of springs and surface runoff such that erosion carries sediment to surface waters and pollutants to local drainages and the underlying aquifer. In addition, land disturbance, material storage, waste disposal, inadvertent chemical or hazardous liquid spills, and compaction produced by vehicular traffic can all affect recharge to the local aquifer and groundwater quality. The Build Alternatives may also result in unavoidable permanent direct, indirect, and temporary impacts to wetlands and their buffers.	See response to Comment ID 20.

EPA (Communication ID 539079)		
Comment ID	**Comment Text**	**Response**
26	**Potential Impacts on Contaminated Sites and Monitoring** If the FTA and Sound Transit reconsider the Midway Landfill Alternative, EPA recommends FTA coordinate with EPA R10 Superfund Program as the project is implemented so that project activities are consistent with agreed upon remedies for the Midway Landfill Superfund site. The EPA Remedial Program Manager is Ashley Grompe, and she may be reached at (206) 553-1284 or grompe.ashley@epa.gov. It will also be helpful to coordinate with Washington State Department of Ecology so that the FEIS identifies all the contaminated sites in the planning area and vicinity and discusses measures to take to minimize project impacts and meet state requirements.	Section 3.13, Hazardous Materials, includes information on the contaminated sites in the planning area and vicinity and discusses measures to take to minimize project impacts and meet state requirements. If the Midway Landfill Alternative is selected as the project to be built, Sound Transit will coordinate with the EPA, Ecology, and other regulatory agencies as appropriate.
27	The DEIS identifies several existing contaminated sites in the project area (up to 64 sites), and the possibility that more contaminated sites could be discovered during construction and operation of the project. Identification of the sites was also limited to a 1/8-mile radius, which is less than the suggested 1-mile radius used for identification of contaminated sites.	The study area for the hazardous materials analysis included the area within a 1/8-mile radius of the construction limits for each build alternative because properties farther than 1/8-mile away present a low probability of having hazardous materials releases that could affect the study area. Please see Section 3.13, Hazardous Materials.
28	**Potential Impacts to Biological Resources** We recommend that the Final EIS include information on working with the U.S. Fish and Wildlife Service and National Marine Fisheries Service, and, as appropriate, with the Washington Department of Fish and Wildlife, including recommended measures to reduce risks and protect biota and habitat. The DEIS indicates the proposed project activities may impact federally and state protected species occurring in the project area and vicinity, such as the threatened Puget Sound Chinook salmon, Puget Sound steelhead, and bull trout. Because of their potential to support fish use, the East and West Fork Hylebos tributaries in the project area are also designated as essential fish habitat for Pacific salmon. The impacts to biological resources will be due to the anticipated loss and degradation of suitable habitats and cover; increased sediment delivery to streams, resulting in increased turbidity; and higher than optimal noise levels during project construction activities that will involve use of excavators and other heavy equipment or machinery. EPA also encourages the FTA to include in the FEIS information on the outcomes of consultations with the Services and coordination with the state agency.	Appendix B, Public Involvement and Agency Coordination, describes Sound Transit's coordination efforts with regulatory agencies and Tribal governments, including the U.S. Fish and Wildlife Service, the National Marine Fisheries Service, and the Washington Department of Fish and Wildlife (WDFW), throughout the course of the project. Sound Transit will continue coordinating with the Tribes and regulatory agencies throughout the final environmental review, permitting, design, and construction of the project. Section 3.10, Ecosystem Resources, of the Final EIS includes a discussion of Endangered Species Act (ESA)-listed species. Additionally, Sound Transit and FTA have prepared a Biological Assessment that evaluates potential impacts of the Preferred Alternative to federally listed species including listed fish. ESA consultation is currently underway with the National Marine Fisheries Service and U.S. Fish and Wildlife Service.
29	**Coordination with Tribes** EPA encourages FTA to incorporate feedback from Tribes when making decisions regarding the project and recommends the FEIS describe the issues raised during government-to-government consultations and how those issues were addressed.	Appendix B, Public Involvement and Agency Coordination, of the Final EIS describes Sound Transit's coordination efforts with regulatory agencies and Tribal governments throughout the course of the project. Sound Transit will continue coordinating with the Tribes and regulatory agencies throughout the final environmental review, permitting, design, and construction of the project.

EPA (Communication ID 539079)		
Comment ID	**Comment Text**	**Response**
30	**Monitoring of the Project and Adaptive Management** EPA recommends the FEIS include a monitoring program designed to assess both impacts from activities and effectiveness of mitigation measures for the impacts and indicate how the program will use an effective feedback mechanism, such as adaptive management, so that any needed adjustments can be made to the activities to meet environmental objectives during project implementation. For example, there could be a plan to monitor noise impacts during project construction and take corrective action if noise complaints or damage claims exceed existing levels.	The OMF South project requirements will require the contractor to conduct noise and vibration monitoring during construction to confirm noise levels are below FTA threshold values. Additionally, the contractor must conduct noise and vibration verification tests before revenue service can begin. Regulatory agencies may require monitoring as part of permit conditions. Sound Transit will comply with all permitting requirements.
31	**Social Cost of Greenhouse Gases** EPA acknowledges the DEIS quantifies the greenhouse gas emissions for operations, maintenance, and construction, including haul truck emissions, for the proposed alternatives. EPA continues to recommend the FEIS estimate the social cost of GHG emissions (SC-GHG) for each alternative to facilitate decisionmakers' and the public's evaluation of the proposed alternatives by monetizing the calculated GHG emissions. This is in alignment with CEQ's January 9, 2023 interim guidance to assist federal agencies in assessing and disclosing climate change impacts during environmental reviews. This guidance was in response to EO 13990, Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis. Alternatively, if choosing to not include SC-GHG in the analysis, provide a basis for that decision.	Section 3.8, Air Quality and Greenhouse Gas Emissions, of the Final EIS has been updated to include a discussion of the social cost of the greenhouse gases that could be emitted under each alternative.

Subject: RE: Notice of Availability - Operations and Maintenance Facility South Draft EIS

Good Morning Erin,

Attached are the FHWA comments on the OMF South Draft EIS. We are also including two reference documents for a review comment on the Ecosystems section.

Let us know if you have any questions or need to meet to resolve our comments.

Thank you,

Lindsey L. Handel, P.E., Senior Level III FAC-P/PM
Urban Transportation Engineer
Federal Highway Administration

FHWA Comments on OMF-South Draft EIS October 2023					
Page	**Section**	**Location**	**Table Row**	**Table Column**	**Comment**
B-9	3.1	Appendix B			Are project updates via listserv provided in languages other than English? Is there an option for individuals to request updates in languages other than English? If so, which languages?
B-9	3.2	Appendix B			How are language access services provided during open house and drop-in sessions? Are multi-lingual staff present?
B-10	3.3	Appendix B			Were language services provided for virtual public hearings? If so, how were they provided? (Break-out sessions in multiple languages, etc.?)Was a sign language interpreter present?
B-11	3.6	Appendix B, 8th Bullet			Simple typo creates significan difference: Title VI (6), instead of Title IV (4)
B-11	3.6	Appendix B			The project web page provides a Google translate feature at the bottom right hand corner of the home page where it blends with the rest of the page. It isn't highlighted or easily identified by bold color or font. This means LEP individuals must scan the entire, English-only, page before locating the translate option. Additionally, the "Select Language" drop-down feature is displayed exclusively in English, which means an LEP individual would have to be able to read English in order to identify that this feature offers translated languages. This is also the case for the "civil rights and complaints" link. How are LEP folx provided meaningful access to language services if they must navigate English-only language in order to identify where these services exist? Placing the "View in other languages" option at the top of the home page, in languages represented in the project area, would provide more meaningful LEP access. On the Title VI page, multiple languages are provided in the top right corner to guide LEP folx to information about the Title VI complaint process. How do LEP folx locate complaint information, in-language, on the home page?
		Title VI Equity Analysis			This appears to be exclusively a EJ analysis and not a Title VI analysis, It does not include all Title VI protected classes or analyze them individually. The analysis aggregates minority populations and includes low-income populations. EJ addresses distribution of high and adverse impacts on minority and low-income populations. EJ analytical standards also recommend aggregating minority populations. Title VI ensures nondiscrimination in programs and activities on the basis of race, color, and national origin (all races, all colors, all national origins) and does not consider low-income. Title VI analytical standards recommend each population be analyzed individually. The Minority Population Distribution maps look at the density of the aggregated minority population but does not evaluate if there is a specific community (race, color, national origin) present that may be disparately impacted.

FHWA Comments on OMF-South Draft EIS October 2023					
Page	**Section**	**Location**	**Table Row**	**Table Column**	**Comment**
4-1	4.1	General Outreach, last paragraph			Indicates "translation assistance" was available during online hearings. Was this oral interpretation or written translation services? If it was translation (written) how was this accommodated in the virtual space? Were there break-out rooms offering translated captioning?
4-2	4.2	Targeted Outreach, 1st bullet			Were in-language lunch groups provided oral-interpretation services or written translation services? May want to make a distinction between what type of services were provided.
4-2	4.2	Targeted Outreach, 2nd bullet			Were translation (written) or interpretation (oral) services provided for open houses?
G1-69	4.2.1.1	TTR			No information was provided regarding increases in freight traffic. If this is captured in the passenger car equivalents, please document that in the text.
		TTR			No discussion of heavy vehicle traffic increases and impacts.
G1-44	3.7				I recommend using fatal and serious crash rates rather than collision rates. Regardless of the pandemic, K and A crashes have increased while total reported crashes have decreased. This assessment should assess what risks are being elevated due to the increases in traffic, both in aggregate and by type.
G1-44	3.7				The traffic safety changes experienced in 2020-2022 are realistic and should not be excluded. Exposure is accounted for by normalizing by VMT and EV. Traffic behavior has changed since 2018 and should be accounted for in decision-making.
		Ecosystems			Essential Fish Habitat should be capitalized throughout.
		Ecosystems			2nd paragraph where study area extent defined, the 300’ extent for pollutants isn’t really consistent with conclusions in second paragraph of 3.10-13 where downstream adverse effects are acknowledged.
3.10-13		Ecosystems			For the discussion on 6PPD-quinone where coho pre-spawn mortality is mentioned, consider expanding to include more recent science on mortality to other salmonids and trout including steelhead, Chinook salmon and rainbow trout (scientific sources provided).
3.11-17		Water Resources			Pg. 3.11-17: States that enhanced treatment for all post-project GIS will be provided. Does this include existing and replaced PGIS?
		Water Resources			Table 3.11-10 shows either a net reduction or no increase in PGIS for the Preferred Alternative but later in the section (3.11.2.2) it states that OMF S. would add PGIS and non-PGIS.

FHWA Comments on OMF-South Draft EIS October 2023					
Page	**Section**	**Location**	**Table Row**	**Table Column**	**Comment**
	3.11.3	Water Resources			The Potential Mitigation (3.11.3) section states that no temporary or long-term adverse impacts on water resources are expected after treatment BMPs are constructed, however in the Ecosystems section, adverse effects downstream are acknowledged. I think it is valid to state that no further mitigation is likely to be required and explain that some adverse effects may occur due to the very low concentrations of some pollutants that are still deemed toxic to some fish species and the fact that even “effective” treatment won’t prevent some discharges from the BMPs that may be above those thresholds.
ES-v		Fact Sheet			There are two separate approval actions for FHWA and they should be called out separately on this list. There is an NEPA Record of Decision, Federal Highway Administration and the Air Space Lease for Use of Interstate Right of Way, Federal Highway Administration.
ES-v		Fact Sheet			FHWA wants to confirm there are no anticipated design approvals or modifications to Interstate 5 with this project, which would require FHWA approval.
3.6.3.1		Environmental Justice			The last paragraph in 3.6.3.1 indicates that EJ populations would accrue benefits through “the addition of new jobs to build the project.” Given the way contractors are selected, there is no way to definitively say the jobs will be given to people in the vicinity of the project. Even with more lenient local hiring rules now, there is no guarantee and we would be more comfortable if this statement was left out—or include a caveat to the statement to explain that it is not a guarantee. Even though it should be obvious given the context, there should be an explaination that the benefits in the last paragraph of this section are all temporary benefits that would occur during construction. If there would be any kind of increased staffing in the area because of the maintenance facility, that could be added as a more permanent benefit related to the economic factors mentioned in this paragraph.
		Environmental Justice			Please include the following (adding FTA if you deem appropriate): "An Executive Order (E.O.) 14096—Revitalizing Our Nation’s Commitment to Environmental Justice for All has been recently enacted (April 21, 2023). The new E.O. 14096 on environmental justice does not rescind EO 12898, which FHWA is implementing through the current DOT and FHWA EJ Orders (DOT 5610.2C and FHWA 6640.23A) until further guidance is provided regarding the implementation of the new E.O. on environmental justice."
	Ch 2				It is difficult from any figure to see where the alternatives would intersect the interstate ROW and cross the access line. Does there need to be a figure with that?
31	3.9.1				It was not stated in the noise analysis specifically but it may be helpful to the reader and existing residents that the reason why there are so few noise impacts from the new mainline extension and test track to the north is because properties will be acquired for the facility, thus there will be some distance between sensitive receptors and the track. This is not exactly clear as there is no map in the technical report that includes model receptor locations.

FHWA Comments on OMF-South Draft EIS October 2023					
Page	**Section**	**Location**	**Table Row**	**Table Column**	**Comment**
37	3.9.2.2	Table 3.9-2 and 3.9-3			It is confusing to the reader that existing noise levels in both tables (specifically S 324th Street to Burning Tree Blvd) do not match. Checking this against tables G2.6-10 and G2.6-11 it looks like the difference is between NB and SB locations. Consider adding the track side column to Table 3.9-2 and 3.9-3.
44	3.9.3.1	First paragraph			"Sound Transit would replace noise walls and berms that would be removed as part of the Preferred And South 344th Street alternatives." State that this would specifically occur on I-5.
	Ch 2				It is difficult from any figure to see where the alternatives would intersect the interstate ROW and cross the access line. Does there need to be a figure with that?
31	3.9.1	Noise			It was not stated in the noise analysis specifically but it may be helpful to the reader and existing residents that the reason why there are so few noise impacts from the new mainline extension and test track to the north is because properties will be acquired for the facility, thus there will be some distance between sensitive receptors and the track. This is not exactly clear as there is no map in the technical report that includes model receptor locations.
37	3.9.2.2	Noise/ Table 3.9-2 and 3.9-3			It is confusing to the reader that existing noise levels in both tables (specifically S 324th Street to Burning Tree Blvd) do not match. Checking this against tables G2.6-10 and G2.6-11 it looks like the difference is between NB and SB locations. Consider adding the track side column to Table 3.9-2 and 3.9-3.
44	3.9.3.1	(Noise) First paragraph			"Sound Transit would replace noise walls and berms that would be removed as part of the Preferred And South 344th Street alternatives." State that this would specifically occur on I-5.
3.3 Acquisitions, Displacements, and Relocations					
3.3	General	General			Missing discussion that relocation resources are available to all people being relocated without discrimination in compliance with Sound Transit's Limited English Proficiency Plan.
3.3-1	3.3	Title			Displacement and relocation really mean the same thing. Displaced person is defined as any person who moves from the real property or moves his or her personal property from the real property. Relocation is provided to displaced persons. This section should really be titled Property Acquisitions and Displacements.
3.3-1	3.3	Entire Section	Includes Notes section under tables		This is really an FTA call however, if this were a WSDOT project, according to WSDOT's ROW manual, environmental reports at this level should not include parcel specific information such as names and possible addresses of potential displacements. This information, if collected, should be kept in a separate project file. The statements should be more general. Instead of calling out Belmor Mobile Home Park, just say mobile home park, GarageTown to storage units, etc..
3.3-5	3.3.3	Title			I wouldn't refer to this section as "Relocation Opportunities". The section is really talking about property availability for displacements so I would suggest using that title.
3.3-5	3.3.3	1st paragraph			Suggest changing "relocation opportunities" to "available properties".

FHWA Comments on OMF-South Draft EIS October 2023					
Page	**Section**	**Location**	**Table Row**	**Table Column**	**Comment**
3.3-6	3.3.3	Table 3.3-3	Notes (2)		Since CoStar does not collect data on availability for potential replacement sites for religious facilities, what other data collection did you explore, e.g. real estate broker in the local market?
3.3-6	3.3.3	3.3.3.1			This section states that finding properties that have specific needs may be more difficult to find. Missing a discussion of the actions proposed to remedy insufficient replacement sites.
3.3-6	3.3.3	3.3.3.2 - Title			Title of section is "Single-Family Residential" and according the Table 3.3-1 under notes residential displacements include individual apartment/condo units and mobile homes. Based on this "Multi-Family should be added to the title.
3.3-6	3.3.3	3.3.3.2			Suggest changing the sentence from saying displaced residents may have to find a location in a different neighborhood to "a similar neighborhood". A comp from either the same neighborhood or similar neighborhood considered in the same market must be provided to the displaced person before the agency can require them to relocate. Also, mobile home displacements can be challenging as inventory is at an all time low. This section is missing a discussion of the actions proposed to remedy insufficient replacement sites, including housing of last resort.
3.3-6	3.3.3	3.3.3.3			The first sentence is contridictory as prior sections stated that finding properties with unique characteristics, such has a religious facility, could be more challenging. Also, in the case of the Church on 25 acres, it can be difficult to relocate due to its size. Missing a discussion of the actions proposed to remedy insufficient replacement sites.
3.3-7	3.3.4	1st paragraph			Suggest changing "relocation opportunities" to "available properties".
3.3-7	3.3.4	2nd paragraph			Not sure if Sound Transit's procedures allow for the use of a waiver valuation but, if they are going to use a waiver valuation for the TCEs or any other right that fits the criteria then they will want to add waiver valuation discussion to this section.
3.3-7	3.3.4	3rd paragraph			2nd sentence needs to be changed as it states in addition to compensating owners which can provide the appearance that the additional compensation is only for owners. Since this sentence deals with relocation expenses it should be revised to state other forms of compensation for displacements could include...... Would also suggest changing "support services" to "advisory services"
3.3-7	3.3.4	4th paragraph			Typically the property owner will approach the agency to request a hardship acquisition and that has a defined process. An agency can also acquire early when they have the legal right to do so. You might revise to state Sound Transit, with FTA's approval is considering early acquisition of the four parcels associated with the church parcel, and it could potentially be acquired as a hardship acquisition if the church makes the request and provides the necessary documentation.

FHWA Comments on OMF-South Draft EIS October 2023					
Page	**Section**	**Location**	**Table Row**	**Table Column**	**Comment**
3.3-8	3.3.4	1st paragraph			This statement is incorrect and should be revised to include all displacements. I would suggest removing "Businesses and tenants" to "Displaced persons" since all (business, farm, NPO, PPO, and residential) are included as defined.
3.3-9	3.3.5	1st paragraph			Advisory services are applicable to more than just property owners. Sentence should be revised - suggest just removing "to property owners".
3.4 Land Use					
3.4.1	3.4	Entire Section			This is really an FTA call however, if this were a WSDOT project, according to WSDOT's ROW manual, environmental reports at this level should not include parcel specific information such as names and possible addresses of potential displacements. This information, if collected, should be kept in a separate project file. The statements should be more general. Instead of calling out Belmor Mobile Home Park, just say mobile home park, GarageTown to storage units, etc..
3.5 Economics					
3.5-1	3.5	Entire Section			This is really an FTA call however, if this were a WSDOT project, according to WSDOT's ROW manual, environmental reports at this level should not include parcel specific information such as names and possible addresses of potential displacements. This information, if collected, should be kept in a separate project file. The statements should be more general. Instead of calling out Belmor Mobile Home Park, just say mobile home park, GarageTown to storage units, etc..
3.5-7	3.5.2.2	Last paragraph			Suggest changing "subsitute" to "suitable" to be consistent with the other areas you reference suitable for business sites.
3.6 Social Resources, Community Facilities, and Neighborhoods					
3.6-8	3.6	Entire Section			This is really an FTA call however, if this were a WSDOT project, according to WSDOT's ROW manual, environmental reports at this level should not include parcel specific information such as names and possible addresses of potential displacements. This information, if collected, should be kept in a separate project file. The statements should be more general. Instead of calling out Belmor Mobile Home Park, just say mobile home park, GarageTown to storage units, etc..
3.6-8	3.6	Preferred Alternative - 2nd paragraph			Suggest referring reader to the Acquisition and Displacements section for discussion on the difficulties associated with relocating a church.

ABSTRACT: *N*-(1,3-Dimethylbutyl)-*N*′-phenyl-*p*-phenylenediamine-quinone (6PPD-quinone), a transformation product of the rubber tire antioxidant 6PPD, has recently been identified as the chemical responsible for urban runoff mortality syndrome in coho salmon, with a median lethal concentration (LC_{50}) of <0.1 μg/L. Subsequent studies have failed to confirm comparable sensitivity in other fish species. Here, we investigated the acute toxicity of 6PPD-quinone to rainbow trout, brook trout, Arctic char, and white sturgeon. Fish were exposed under static renewal conditions, and exposure concentrations were verified analytically. Mortalities in brook trout occurred between 1.2 and 20 h, while mortalities began after 7 h and spanned 60 h in rainbow trout. The LC_{50}s in brook trout (24 h) and rainbow trout (72 h) were 0.59 and 1.00 μg/L, respectively. Both species showed characteristic symptoms (increased ventilation, gasping, spiraling, and loss of equilibrium) shortly before death. No mortalities were observed after exposure of either char or sturgeon for 96 h at measured concentrations as high as 14.2 μg/L. This is the first study to demonstrate the acute toxicity of 6PPD-quinone to other fishes of commercial, cultural, and ecological importance at environmentally relevant concentrations and provides urgently needed information for environmental risk assessments of this contaminant of emerging concern.

■ INTRODUCTION

Stormwater runoff from urban landscapes has long been a cause for environmental concern due to its chemical complexity, toxicity to aquatic organisms, and temporal and spatial dynamics.[1] In addition to road salt, organic contaminants from vehicle emissions and leakage, and toxic metals from brake pad abrasion,[2] tire wear particles (TWPs) have recently become the focus of scientific and public interest.[3] Earlier research into the causes of fish kills following rainfall events along the west coast of the United States, termed coho salmon (*Oncorhynchus kisutch*) urban runoff mortality syndrome (URMS), suggested that rubber tire-derived chemicals might be responsible for this effect because they co-occurred with these mortality events.[4] In a landmark study, Tian et al.[5] applied a combination of fractionation, chemical analysis, and biological testing to pinpoint the causative chemical. The authors found that *N*-(1,3-dimethylbutyl)-*N*′-phenyl-*p*-phenylenediamine-quinone (6PPD-quinone) was generated through the environmental oxidation of the common rubber tire antidegradant 6PPD and can cause lethality in coho salmon at a median lethal concentration (LC_{50}) of <0.8 μg/L. Using a commercial standard, a revised LC_{50} in coho salmon of <0.10 μg/L was reported in a follow-up study.[6] Tian et al.[5,6] and subsequent studies have demonstrated the widespread occurrence of 6PPD-quinone in stormwater runoff and surface waters at concentrations of ≤19 μg/L,[7,8] indicating that 6PPD-quinone exposure poses an immediate risk to coho salmon populations. However, it was unknown whether exposure to this pollutant would also affect other aquatic species.

Two follow-up studies have determined the acute toxicity of 6PPD-quinone to a variety of species, including fish (zebrafish, *Danio rerio*; Japanese medaka, *Oryzias latipes*) and invertebrates (*Daphnia magna* and *Hyalella azteca*).[9,10] All tested species were significantly less sensitive than coho salmon: exposure to 6PPD-quinone did not cause lethality in any of the four species studied by Hiki et al.[10] up to concentrations as high as the maximum water solubility, which the authors estimated to range between 34 and 54 μg/L. Varshney et al.[9] observed an LC_{50} of 309 μg/L for zebrafish larvae when ethanol was used as the solvent vehicle. Because of the

alarmingly high sensitivity of coho salmon to 6PPD-quinone, environmental risk assessors urgently require data on the acute toxicity of 6PPD-quinone across a greater diversity of fish species, with an emphasis on additional salmonid species.

This study investigated the acute toxicity of 6PPD-quinone across four species of commercial, cultural, and ecological importance to North America: rainbow trout (*Oncorhynchus mykiss*), brook trout (*Salvelinus fontinalis*), Arctic char (*Salvelinus alpinus*), and white sturgeon (*Acipenser transmontanus*). Additionally, rainbow trout are an important model fish species used in chemical risk assessment across many jurisdictions.[11,12] This research provides important information for the environmental risk assessment of urban runoff and has the potential to inform regulatory controls of the use of 6PPD in rubber tires.

■ MATERIALS AND METHODS

Chemicals and Reagents. Native and mass-labeled (d_5) 6PPD-quinone were purchased from Toronto Research Chemicals (Toronto, ON). Stock solutions for exposure of fish to 6PPD-quinone were prepared using dimethyl sulfoxide (DMSO) to achieve a final solvent concentration of 0.01% (v/v) during exposures. Analytical standard solutions of native and mass-labeled 6PPD-quinone were prepared in HPLC-grade methanol.

Fish Source and Culture. Brook trout were from Allison Creek Trout Hatchery (Coleman, AB), were ∼1 year old, were 17.1 ± 1.1 cm in length, and weighed 52.8 ± 7.6 g. Fish were housed in the Aquatic Research Facility (ARF) at the University of Lethbridge and acclimated in 150 L inert glass-fiber Krescel tanks (four fish per tank, 30% daily water renewal) for 2 weeks prior to exposures. Fish were fed a commercial salmonid feed at a daily rate of 1% of body weight during acclimation. Studies were approved by the University of Lethbridge Animal Welfare Committee (Protocol 2111).

Rainbow trout (from Lyndon Hatcheries, New Dundee, ON), Arctic char (from Miracle Springs Inc., North Vancouver, BC), and white sturgeon (wild fish spawned at the Nechako White Sturgeon Conservation Centre, Vanderhoof, BC) were from in-house cultures raised from embryos in the Aquatic Toxicology Research Facility (ATRF) at the University of Saskatchewan. Fish were cultured under flow-through conditions in facility water until they reached the juvenile stage (rainbow trout, ∼2 years, 19.6 ± 1.9 cm, 97.5 ± 28.9 g; Arctic char, ∼3 years, 13.8 ± 1.7 cm, 28.3 ± 9.8 g; white sturgeon, ∼4.5 years, 42.4 ± 4.5 cm, 462.3 ± 159.3 g) and fed with a commercial fish feed at a daily rate of 1% of body weight during acclimation. Even though fish were somewhat larger than recommended according to various guidelines for acute toxicity tests, all fish were sub-adult and the larger size was selected due to availability considerations and to provide sufficient tissues for downstream analyses. Experiments were approved by the University of Saskatchewan Animal Care Committee (Protocol 20070049). A Species at Risk Act (SARA) permit for culture of and experimentation with white sturgeon was obtained from the Department of Fisheries and Oceans Canada (Permit 20-PPAC-00026).

Exposure Experiments. Pilot studies were conducted for each species to establish upper concentration bounds for acute lethality studies. For brook trout, fish were fasted for 24 h, moved to aerated 45 L rectangular glass tanks (two fish per tank) at 10 °C, and exposed for 24 h to nominal concentrations of 0, 0.02, 0.2, 2, or 20 μg/L 6PPD-quinone under static conditions (10 fish total). For the other species, two fish per species were each exposed under static conditions in individual tanks at either 6 or 20 μg/L (two fish total per species). Brook trout and rainbow trout became moribund at 2 and 6 μg/L, respectively, within 4 h of the onset of exposure. Arctic char and white sturgeon did not show any response to concentrations as high as 20 μg/L within 96 h.

Accordingly, in the main experiment, brook trout and rainbow trout were exposed to nominal concentrations of 6PPD-quinone ranging from 0.1 to 6 μg/L (see Table S1 for details). Tanks were cleaned with a series of detergents, disinfectants, and/or ethanol, carefully rinsed, and left to dry before experiments. Due to their lower sensitivity, Arctic char and white sturgeon were exposed to only one nominal concentration (20 μg/L) that could be achieved using the limited amount of chemical available and that was nearing water solubility, while still being environmentally relevant.[5,7,8] Exposures of brook trout were performed in 150 L inert glass-fiber Krescel tanks at 10 ± 1 °C for 24 h (two replicate tanks with four fish each; two controls at five concentrations, 56 fish total). A shorter exposure period was chosen for brook trout due to a much faster onset of symptoms compared to rainbow trout. Test solutions were continuously aerated, recirculated, and temperature controlled. Rainbow trout, white sturgeon, and Arctic char were exposed in 700 L glass-fiber Min-o-Cool tanks containing 500, 500, and 300 L of test solution, respectively, at 12 ± 1 °C for 96 h under static renewal conditions. Water was exchanged at 40−60% (white sturgeon) or 75% (rainbow trout and Arctic char) daily (two replicate tanks and one extra control replicate with five fish each for rainbow trout, 65 fish total; two replicate tanks with five fish each for Arctic char, 20 fish total; three replicate tanks with two fish each for white sturgeon, 12 fish total). Control tanks were dosed with the DMSO solvent vehicle at the same level as all other tanks [0.01% (v/v)]. Average (±SD) water quality parameters were as follows for brook trout: temperature, 10.3 ± 0.7 °C; pH, 6.74 ± 0.13; DO, 99.8 ± 11.5%; ammonia, 0.13 ± 0.11 mg/L; hardness, 131 ± 2.33 mg/L. Average (±SD) water quality parameters were as follows for other species: temperature, 12.8 ± 0.8 °C; pH, 8.35 ± 0.45; DO, 92.8 ± 13.2%; ammonia, 0.14 ± 0.15 mg/L; hardness, 132 ± 6.80 mg/L. Water samples were collected for analytical confirmation of concentrations of 6PPD-quinone ∼1 h after the initial dosing of tanks, which occurred after acclimation of fish for 48−96 h. For rainbow trout, Arctic char, and white sturgeon, a water sample was also taken every 24 h prior to water changes or after most fish in a tank became moribund. Samples were immediately spiked at 50 μg/L with 6PPD-quinone-d_5 and stored at −20 °C until they were analyzed. Fish were observed during most of the exposure duration, immediately removed once they became moribund, and humanely euthanized using >250 mg/L buffered MS-222. Characteristic signs of 6PPD-quinone exposure leading to brook trout and rainbow trout becoming moribund (increased ventilation rate, gasping on the water surface, permanent loss of equilibrium, and spiraling motion) were observed during regular tank inspections and noted and would have resulted in death within 0.5 h if fish were not euthanized.

Biological Sampling. The fork length (millimeters) and weight (grams) of each fish were determined after euthanasia. Blood samples were obtained from the caudal vein using heparinized syringes, and blood glucose concentrations determined using hand-held meters (brook trout, OneTouch

https://doi.org/10.1021/acs.estlett.2c00050

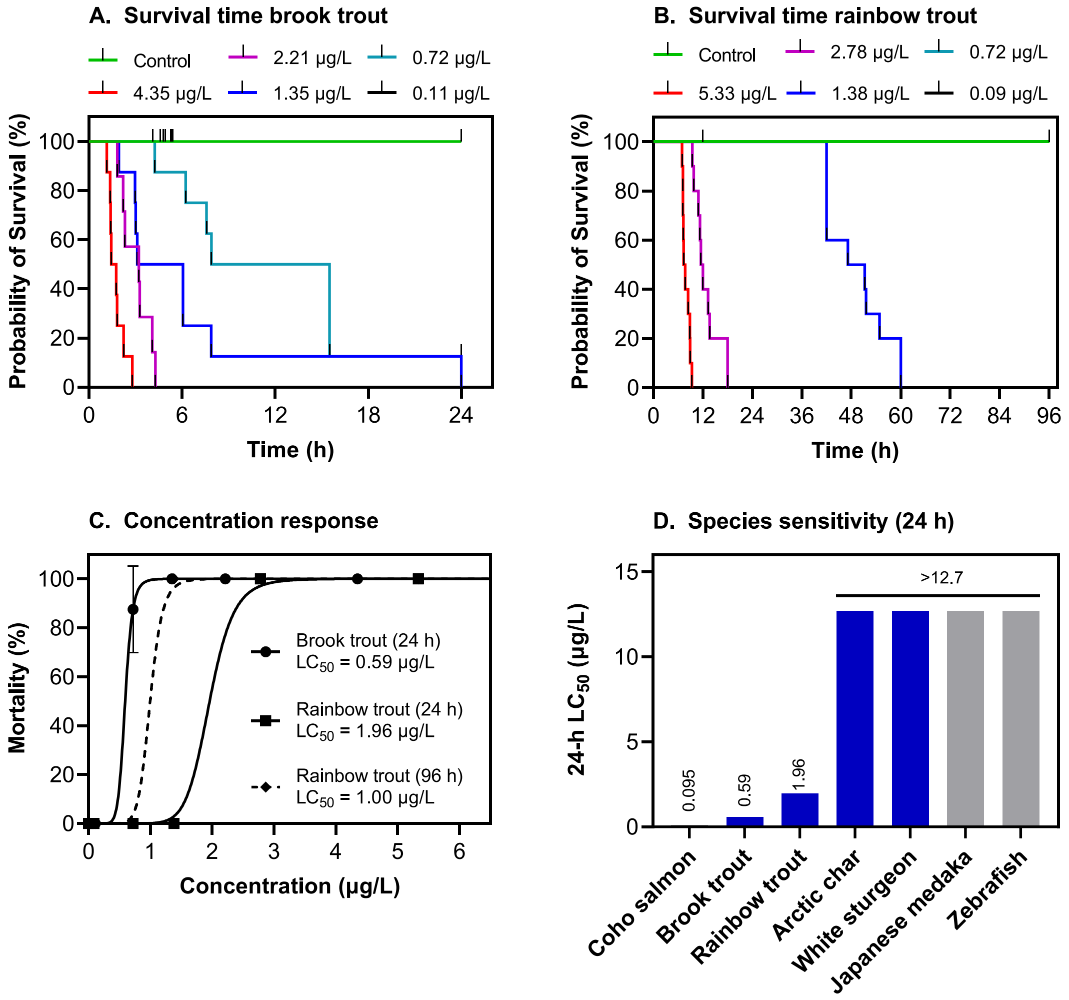

Figure 1. Relationships among exposure time, exposure concentration, and survival in (A) brook trout and (B) rainbow trout over exposure durations of 24 and 96 h, respectively. Median lethal concentrations at 24 and 96 h of exposure were interpolated for both species using (C) two-parameter logistic regression and (D) compared with those of other previously studied species. All concentrations are based on measured concentrations. Blue bars in panel D are from this study, while values for coho salmon, Japanese medaka, and zebrafish have been previously published.[6,9,10]

Ultra 2 m, LifeScan, Malvern, PA; all other species, Contour Next meter, Ascensia, Basel, Switzerland). The percent hematocrit was determined in brook trout using a StatSpin CritSpin microhematocrit centrifuge (StatSpin, Norwood, MA).

Analytical Chemistry. Instrumental verification of exposure concentrations of 6PPD-quinone followed the method outlined by Challis et al.[7] with modifications. Briefly, samples were analyzed on a Vanquish UHPLC instrument coupled with a Q-Exactive HF Quadrupole-Orbitrap hybrid mass spectrometer (Thermo-Fisher). An isotope dilution strategy using 6PPD-quinone-d_5 was applied for quantification. Average measured exposure concentrations were calculated and used for subsequent data analysis instead of nominal exposure concentrations. A detailed description of the analytical methods is provided in the Supporting Information.

Data Analysis and Statistics. The percent mortality for each concentration and replicate was calculated at 24 h for brook trout and at 24 and 96 h for rainbow trout to account for differences in time to death between both species. LC_{50}s were interpolated for each time point using logistic regression of the percent mortality versus average measured exposure concentrations. Blood glucose measurements were analyzed for normality and heteroscedasticity using Kolmogorov−Smirnov's test and Levene's test, respectively. Because the data sets violated the assumptions for one-way analysis of variance (ANOVA), a nonparametric Kruskal−Wallis's test with Dunn's post hoc test was performed. A p value of ≤ 0.05 was considered indicative of statistically significant differences. All plots were created and statistically analyzed using Prism 9 (GraphPad, La Jolla, CA).

■ RESULTS AND DISCUSSION

Analytical Verification of Exposure Concentrations. Average concentrations of 6PPD-quinone measured over the exposure periods deviated <16% from nominal values across all species with the exception of the low-treatment groups for brook trout and rainbow trout (Table S1). There was an average loss of 14% (1.7% and 32% in the high- and low-treatment groups, respectively) of the test chemical over the 24 h window between water changes, suggesting exposure levels were stable throughout the experiments. Losses were slightly greater at the higher exposure concentrations used for Arctic char and white sturgeon. Hiki et al.[10] reported a 17−73% decrease in 6PPD-quinone concentrations over 48 h between water changes for zebrafish and medaka, confirming the

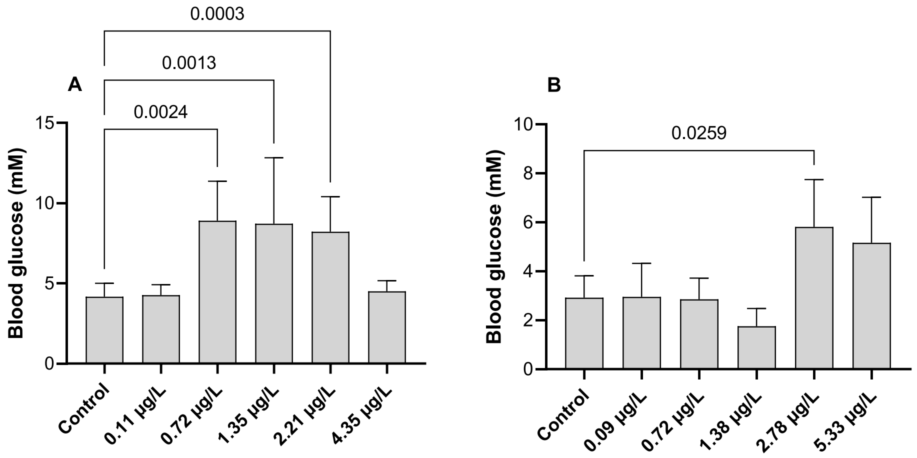

Figure 2. Blood glucose concentrations in (A) brook trout and (B) rainbow trout in moribund animals and those that survived until termination of the experiment following exposure to graded nominal concentrations of 6PPD-quinone. Bars depict the mean, and error bars the standard deviation of 4−15 fish per treatment and species, rather than tank replicates. Because control fish taken down at different sampling times did not differ significantly, individuals were pooled in a single control group for this analysis. Concentrations are based on measured exposure concentrations. Numbers above the brackets indicate the *p* value of statistical comparisons of blood glucose concentrations in 6PPD-quinone-exposed fish with those of the control group (Kruskal−Wallis ANOVA on ranks with Dunn's post hoc test).

relative stability of this chemical under static renewal conditions.

Acute Toxicity of 6PPD-quinone in Fish. Exposure to 6PPD-quinone resulted in significant acute effects in two of the four tested species, which varied as a function of chemical concentration, exposure time, and species (Figure 1). Brook trout were most sensitive with 100% of mortalities in the high-treatment group occurring within 3 h of exposure and a 24 h LC_{50} of 0.59 μg/L [95% confidence interval (CI) of 0.48−0.63 μg/L], which is similar to previous observations in coho salmon.[5] A slightly greater LC_{50} of 1.00 μg/L (95% CI of 0.95−1.05 μg/L) was recorded for rainbow trout after 72−96 h (1.96 μg/L after 24 h, 95% CI of 1.86−2.06 μg/L), while no mortalities were observed for either Arctic char or white sturgeon at measured concentrations as high as 14.2 and 12.7 μg/L after 96 h. Interestingly, in rainbow trout, the first signs of morbidity did not manifest until 7 h after commencing exposures and maximum mortalities occurred at 60 h, which was significantly longer than the times for brook trout and coho salmon.[5] The LC_{50} values reported here for brook trout (0.59 μg/L) and rainbow trout (1.00 μg/L) were ∼6-10-fold greater than that of coho salmon (0.10 μg/L) and are well within ranges of environmental concentrations of 6PPD-quinone previously reported in Canadian and U.S. surface waters after stormwater runoff events.[5−8] While no mortality of endangered white sturgeon or Arctic char was observed after exposure to 6PPD-quinone, potential subchronic or chronic impacts have not been fully studied and cannot be excluded at this time.

These results support earlier reports that identified marked differences in the sensitivity of fishes to exposure with 6PPD-quinone and TWP leachates.[3,5,10] Previous studies have hypothesized that sensitivity to 6PPD-quinone may be unique to salmonids.[9] These authors, who assessed the acute toxicity of this chemical to Japanese medaka and zebrafish, did not observe any significant mortalities up to the limit of the water solubility of 6PPD-quinone, which was estimated to range between 34 and 54 μg/L. While this is in accordance with the lack of effects reported in white sturgeon in this study, our results for Arctic char as well as those reported for TWP leachates by McIntyre et al.[3,5] for chum salmon (*Oncorhynchus keta*) clearly demonstrate the tolerance of these two salmonid species. Thus, we can conclude that sensitivity to acute exposure with 6PPD-quinone is highly variable among fishes in general, and salmonids specifically, even among species from the same genus such as brook trout and Arctic char representing the genus *Salvelinus*, and rainbow trout, chum salmon, and coho salmon representing the genus *Oncorhynchus*.

In cases in which mortalities occurred, both brook trout and rainbow trout exhibited behaviors consistent with those observed in coho salmon,[3,5] including hovering close to the water surface, accelerated opercular movements, gasping, and spiraling motion. This is in accordance with the hypothesis by McIntyre et al.[3] and Varshney et al.[9] that these types of behavior are suggestive of 6PPD-quinone causing cardiorespiratory distress. A significant increase in blood glucose concentrations observed at 0.72−2.21 μg/L in brook trout and 2.78 μg/L in rainbow trout (Figure 2) indicates that 6PPD-quinone impacted energy metabolism, although the underlying mechanisms for this increase are currently unclear. Additionally, hematocrit of brook trout exposed to 0.72−4.35 μg/L 6PPD-quinone significantly increased from an average of 42% in the control group to 68% at 4.35 μg/L (Figure S4). This agrees with observations by Blair et al.,[13] who found even more pronounced increases in hematocrit in coho salmon following exposure to urban runoff. The authors also provided evidence of the disruption of the blood−brain barrier in exposed fish, which might be one of the reasons for the observed increases in hematocrit. However, it is currently unclear if this is the key event ultimately responsible for causing death or if other processes are involved.

Environmental Implications and Risk Assessment. Salmonids are of significant ecological, commercial, and recreational importance in many countries around the world, and this study highlights that the acute toxicity of 6PPD-quinone previously reported for coho salmon[3,5] is also of significant concern for other key receptors, including rainbow trout and brook trout. While there have only been a limited number of studies that characterized the presence of 6PPD-

https://doi.org/10.1021/acs.estlett.2c00050

quinone in surface waters and urban runoff,[7,8] available reports clearly highlight that commonly found concentrations of this emerging contaminant exceed toxicity thresholds reported here and by Tian et al.[5] Hence, 6PPD-quinone appears to pose a significant and widespread ecological risk to these species, and potentially other salmonids, especially downstream of urban areas and in smaller water bodies receiving roadway runoff.[5,7,8] However, other ecologically relevant genera and families of fishes have not been studied to date, which represents an important uncertainty at this point.

The observed differences in the temporal dynamics of time to death among the three species for which acute effects of 6PPD-quinone have been observed to date are interesting. While in coho salmon[5] and brook trout morbidities at the greatest concentrations were observed as early as 1−2 h after initiation of exposure, in rainbow trout the first mortalities did not occur until ∼7 h at comparable concentrations. As exposure conditions were comparable among experiments in terms of temperature (10−13 °C), pH (6.7−8.3), and DO (>90% saturation), it is unlikely that these parameters would have been a driving factor. Despite the similar LC_{50} values observed for all three species, these differences may have significant implications for ecological risk assessment of urban runoff events. The shorter time to death for coho salmon and brook trout may increase their risk of mortality prior to dilution of stormwater in receiving water bodies over time after rain events.

Future Research Needs. For more comprehensive future risk assessments of 6PPD-quinone in aquatic ecosystems, it is imperative to study its acute and sublethal effects in a broad range of fish species. More research into the potential respiratory or cardiovascular mechanisms of action is needed to conclusively and comprehensively elucidate the specific mechanism by which 6PPD-quinone triggers URMS in select salmonids and possibly other fishes. Most importantly, drivers of species differences in sensitivity need to be studied; i.e., why are some salmonids more sensitive than others? Several native salmonid fish species (e.g., cutthroat trout, *Oncorhynchus clarkii*; bull trout, *Salvelinus confluentus*)[14−16] are at risk of extinction in parts of their native range, and the contribution of 6PPD-quinone to their stock status needs to be urgently investigated.

Susceptibility to
Roadway Runoff: Coho > Steelhead > Chinook > Sockeye

ABSTRACT: We compared the sensitivity of closely related Pacific salmon and steelhead (*Oncorhynchus* spp.) to untreated urban stormwater runoff across three storm events. Juvenile coho, sockeye, steelhead, and Chinook were exposed for 24 h to untreated urban runoff and then transferred to clean water for 48 h. As anticipated from previous studies, coho were highly susceptible to runoff toxicity, with cumulative mortality rates ranging from 92%−100% across the three storms. By contrast, juvenile sockeye were unaffected (100% survival), and cumulative mortality rates were intermediate for steelhead (4%−42%) and Chinook (0%−13%). Furthermore, coho died rapidly following the onset of stormwater exposure (generally <4 h), whereas mortality in Chinook and steelhead was delayed by 1−2 days. Similar to previous findings for coho, steelhead and Chinook did not recover when transferred to clean water. Lastly, significant mortality occurred in coho even when roadway runoff was diluted by 95% in clean water. Our findings extend the urban runoff mortality syndrome in salmonids and point to a near-term need for sublethal studies in steelhead and Chinook to more precisely understand stormwater risks to threatened species recovery efforts in the western United States.

KEYWORDS: *urbanization, stormwater, endangered species, Oncorhynchus, microplastics, 6PPD-quinone, urban runoff mortality syndrome, tire wear particles*

INTRODUCTION

Recent advances in analytical methods have made it increasingly possible to fractionate urban stormwater runoff into individual and identifiable toxic components. These efforts have yielded several chemicals of emerging concern (CECs) that are derived primarily from vehicle tires and therefore ubiquitous in roadway runoff.[1,2] Many are essentially unknown to ecotoxicology despite an apparent prevalence in the environment[3,4] and rapid mobilization in stormwater runoff.[5−7] One such CEC is *N*-(1,3-dimethylbutyl)-*N*′-phenyl-*p*-phenylenediamine (6PPD), an antiozonant added during the manufacture of tires to help prevent tread degradation. Ozone abiotically converts 6PPD into 6PPD-quinone, as well as other transformation products.[8]

For the past two decades, researchers in the Pacific Northwest of the United States (U.S.) have been studying a severe urban runoff mortality syndrome in coho salmon (*Oncorhynchus kisutch*). This forensic investigation eventually led to the discovery of 6PPD-quinone (6PPD-q) as the primary causal agent in the urban runoff mortality phenomenon.[4] Recurring, stormwater-driven dieoffs pose a significant threat to the near-term and long-term conservation of wild coho populations,[9] several of which are currently managed under the U.S. Endangered Species Act (ESA). The conservation implications for ESA-listed salmon are considerable, given high rates of premature death (up to 90% or more) among adult coho returning to spawn in urban watersheds, as documented in field surveys across multiple years in Puget Sound and elsewhere.[10,11]

At present, uncertainty around the extent to which roadway runoff toxicants, including 6PPD-q and other tire antioxidant/antiozonant transformation products, impact aquatic taxa beyond coho is spurring a global effort in ecotoxicology.[3,12,20] Although environmental health data are limited, there appears to be variation in vulnerability to roadway runoff even among closely related species of Pacific salmon belonging to the genus *Oncorhynchus*. This is evident from recent studies, wherein adult coho and chum (*O. keta*) were exposed to urban runoff or tire leachate, with high mortality observed in coho but not chum.[13,14] These differences in survival were consistent with observations from field surveys that previously documented

high rates of premature spawner mortality in coho but not chum in restored urban catchments.[10] However, the vulnerability of other Pacific salmonids to urban roadway runoff, including sockeye (*O. nerka*), Chinook (*O. tshawytscha*), and steelhead (ocean-going rainbow trout; *O. mykiss*), has not been determined. In the context of the ESA, this represents a major information gap, particularly for stream-type Chinook and steelhead that spend proportionately more time in freshwater habitats as juveniles, where they are more likely to be exposed to runoff from the transportation grid. Moreover, relative to coho, ESA-listed Chinook and steelhead populations encompass a much wider range of river basins in the western U.S., particularly in California (see www.fisheries.noaa.gov/species-directory/threatened-endangered for current ESA range designations).

It was recently shown that juvenile coho, in addition to spawning adults, are highly susceptible to the mortality syndrome.[15] Salmonids other than coho, including *O. mykiss*, also appear vulnerable.[12] In the present study, we extended these earlier observations by coexposing juvenile coho, sockeye, Chinook, and steelhead to runoff collected during multiple rain events. We focused on small subyearlings (coho, sockeye, Chinook) as well as larger age 1+ juveniles (coho, steelhead), and used coho as a positive control for the baseline toxicity of untreated stormwater (i.e., as confirmation of the mortality syndrome). Our study had three primary objectives: (1) determine whether ESA-listed species other than coho are vulnerable to acutely lethal stormwater toxicity, (2) evaluate the time course for mortality across species and whether affected fish recover in clean water, and (3) assess the role of dilution as a factor influencing survival, using juvenile coho as an indicator species.

■ MATERIALS AND METHODS

Urban Roadway Runoff Collection and Transport. Urban stormwater was collected from downspouts draining a short section of elevated urban arterial (west-bound onramp to State Route 520 from Montlake Boulevard in Seattle, Washington). Runoff from six storms was collected at different times of the year in 2018 (August 26, October 25, and December 17) and 2019 (March 12, March 25, and April 4). During each storm event, runoff was filtered through a fiberglass window screen to remove coarse debris and collected in 900 L or 1325 L stainless steel collection totes (Custom Metalcraft Inc., Springfield MO) for subsequent transport at ambient temperature to the Washington State University Research and Extension Center in Puyallup (WSU-P). Juvenile salmonid exposures were initiated within 24 h of each storm event. Note that 6PPD-q levels in runoff from this location have been previously measured across nine storms in 2017−2019,[4,19] including the October and December collection events used here in 2018; all storms contained 6PPD-q at concentrations expected to be lethal to juvenile coho (Table S3).

Juvenile Salmon and Steelhead. Juvenile coho, sockeye, and Chinook salmon as well as an ocean-migrating stock of *O. mykiss* (hereafter referred to as steelhead) were obtained from local hatcheries, held in a recirculating freshwater system at WSU-P on a 12:12 h dark:light cycle, and fed daily with commercial fish food (BioVita, Bio-Oregon). Fish rearing water consisted of municipal water treated with reverse osmosis and adjusted to pH 7.6 and a conductivity of 1500 μS/cm, then passed through a bead filter, UV reactor, bioreactor, and chiller. Sockeye prefer cooler waters (8 °C optimum), and thus exposure temperatures were maintained at 5.0−10.3 °C for the cross-species vulnerability experiments involving sockeye and the three other salmonids. For the dilution experiments (coho only), temperatures ranged from 10.0 to 12.1 °C. Fish sizes and water quality measurements for all experiments are described in the Supporting Information (Tables S3 and S4); experimental protocols were approved by Washington State University's Institutional Animal Care and Use Committee.

Stormwater Exposures to Assess Species-Specific Sensitivity. For the multispecies comparisons, replicate groups of juvenile salmonids were exposed to undiluted roadway runoff (100% stormwater) for 24 h following each of the three 2019 storm events and then transferred to clean (rearing) water for an additional 48 h (Table S1). Coho served as positive controls for the urban mortality syndrome in side-by-side exposures using subyearlings (coho, sockeye, and Chinook) and larger age 1+ salmonids (coho and steelhead). We selected an ocean-migrating stock of *O. mykiss* to differentiate the steelhead life history from domesticated, freshwater-resident strains of rainbow trout.

Static exposures were carried out in 35 L glass aquaria containing either 30 L of clean water or 100% stormwater. For the smaller fish (subyearling coho, Chinook, and sockeye), 9−10 fish were placed in each of the three replicate exposure tanks. For the larger (age 1+) coho and steelhead, $n = 6$ fish were placed in each of four replicate exposure tanks. A few fish escaped into the surrounding water bath and were excluded (Table S1).

Exposure tanks were supplied with air stones for oxygenation (>10 mg/L) and placed in flow-through water baths with chillers to maintain temperatures. Across all three storms, mortality was monitored throughout exposure periods at regular intervals (2, 4, 8, and 24 h). Final reported mortality counts included moribund fish that did not react to gentle prodding and were removed and euthanized with MS-222 (400 mg/L) followed by severing the spinal cord.

All fish surviving the 24 h exposure were transferred to larger (57 L) tanks containing clean water for a 48 h depuration. For the smaller fish (subyearling coho, Chinook, and sockeye), individuals were removed from the three replicate exposure tanks and grouped into a single depuration tank with a maximum number of 30 fish per tank. For the larger age 1+ coho and steelhead, fish from individual exposure tanks were divided evenly into two depuration tanks ($n = 12$ maximum per tank, to adjust for larger fish). Moribund and dead fish were monitored and removed midway through depuration (48 h) and at the end of depuration (72 h).

Stormwater Exposures to Assess the Influence of Dilution on the Mortality Syndrome. To evaluate dilution, juvenile coho were exposed to a graded stormwater concentration series for 24 h following three storms in 2018 (Table S2). Juvenile coho (age 1+; Table S4) were placed in static exposure chambers as described above. Glass aquaria (35 L) were filled with either 30 L of clean water or urban stormwater diluted to 25%, 11.2%, 5%, 2.2%, or 1% with clean water. For the August and December storms, individual fish ($n = 8$, adjusted for size) were placed in each of three replicate tanks per concentration. For the October storm, a mechanical failure (chiller) necessitated a shift in experimental design, whereby $n = 10$ fish were exposed in each of the two replicate tanks per dilution. Mortality was enumerated as described above.

Statistical Analyses. Statistical analyses were developed using R (https://www.r-project.org/) and RStudio (https://www.rstudio.com). Mortality was calculated in proportion to the total number of individuals across all tanks within a given treatment (e.g., exposure, species, time, and/or dilution; see data in Tables S1 and S2). For each observed proportion, the 95% confidence interval was calculated using the BinomCI function from the DescTools R package with the "modified Wilson" method to account for proportions near 0 and 1 (presented as percentages in Figure 1). Differences among treatments were determined by comparing confidence intervals around the observed proportions.

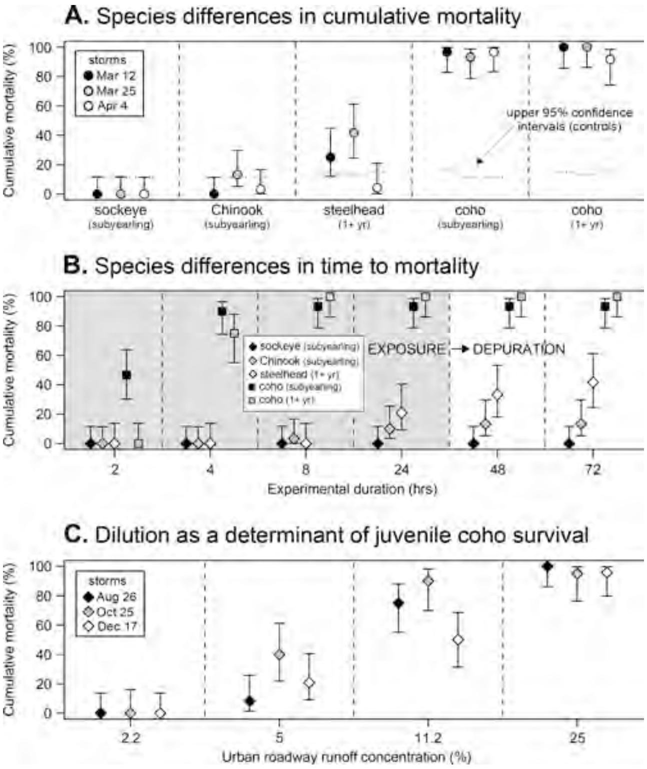

Figure 1. Cumulative mortality (% and 95% confidence interval) of juvenile Pacific salmonids exposed to urban roadway runoff. (A) Species differences across three storms following 24 h exposure and 48 h depuration. Upper 95% confidence intervals of controls are shown as dotted lines. (B) Species differences in mortality over time for a single storm (March 25) after 24 h exposure (gray shaded area) and 48 h depuration (unshaded area). (C) Mortality in coho (1+ yr) exposed for 24 h to different dilutions of roadway runoff over three storms. No mortality was observed in controls. (A−C) Data from all control and exposed fish are shown in Tables S1 and S2. Fish age is noted as subyearlings or 1+ yrs.

■ RESULTS AND DISCUSSION

Varying Mortality in Response to Untreated Stormwater Across Salmonid Species. Juvenile sockeye, Chinook, and steelhead, as well as two size classes of juvenile coho (positive controls), were exposed to untreated roadway runoff from three separate storm events (Figure 1A). As anticipated from earlier studies,[4,15,16] subyearling and larger (age 1+) coho were highly susceptible to toxic runoff, as evidenced by >90% cumulative mortality (Figure 1A; rightmost panels) across all three 2019 storms. Conversely, all juvenile sockeye survived 24 h exposures to runoff, irrespective of the storm, similar to previous observations of 100% survival for chum.[13,14] The response of juvenile Chinook was less consistent, with only modest mortality in response to the second (March 25) storm. Steelhead were intermediate between sockeye (no deaths) and coho (almost no survivors), with proportionately higher mortality for the first and second storms (Figure 1A).

Species-Specific Timelines for the Mortality Syndrome. Among Pacific salmonids, the stormwater mortality phenomenon has primarily been studied in coho, where the progression of the syndrome—from asymptomatic fish to visible distress (disorientation, loss of equilibrium) to death—occurs over a span of a few hours in fish exposed to 100% stormwater. In accord with earlier published results,[15] juvenile coho began dying soon during exposure (2−4 h), with near-maximal cumulative mortality within 8 h (Figure 1B; stormwater exposure window in shaded panels at left). Relative to coho (positive controls), the progressions of symptoms in Chinook and steelhead were qualitatively the same (surface swimming and gaping, loss of equilibrium) albeit with a delayed onset and a longer window for mortality thereafter, with fish generally dying toward the end of the 24 h exposure or after subsequent transfer to clean water. Hence, similar to coho,[15] the distress syndrome in Chinook and steelhead appears irreversible.

Influence of Dilution on Coho Survival. Our sourcing of stormwater from an urban arterial with high traffic volume (relatively concentrated runoff) is well suited for studies of green infrastructure effectiveness[16,17] but is less representative of exposure conditions in salmon habitats where stormwater is diluted by receiving waters. To evaluate the influence of dilution on survival, juvenile coho were exposed to runoff from three separate storm events for 24 h, at concentrations ranging from 1% to 25%. Mixtures containing 5% or more stormwater were generally lethal to juvenile coho (Figure 1C). Note that the upper end of the exposure range (25% runoff diluted in clean water) was chosen based on maximal coho lethality in pilot experiments; untreated surface runoff is likely to represent more than 25% of receiving surface water volumes in many urban watersheds.

Implications. In the U.S. Pacific Northwest, the urban runoff mortality phenomenon has been studied intensively for the past two decades, with a primary focus on adult coho returning from the ocean to spawn in urbanized Puget Sound watersheds.[10,18] Wild coho populations are unlikely to withstand the high rates of dying spawners previously and consistently documented in urban stream reach surveys.[9] The mortality syndrome was subsequently extended to juvenile coho,[15] which enabled relatively high-throughput testing of stormwater fractions and set the stage for the eventual discovery of 6PPD-q as the causative agent.[4] Because the parent compound (6PPD) and other chemicals similar in structure and function are ubiquitous in motor vehicle tires worldwide, there has been an expanding effort to identify other fish species at risk from exposure to untreated roadway runoff. Our current findings extend the urban runoff mortality phenomenon to steelhead and Chinook but with phenotypic nuances in severity (less) and time course (longer) relative to coho. Nevertheless, the characteristics of the syndrome in coho exposed to roadway runoff (e.g., the present study; Chow et al.[15]) or 6PPD-q alone (e.g., Tian et al.[4]) are the same, implying a common underlying mechanism. The discussion that follows therefore hypothesizes that the coho, steelhead, and Chinook toxicity observed here was caused by 6PPD-q across the different stormwater collections, an assumption further supported by recent findings for *O. mykiss.*[12] For context, coho are exceptionally sensitive to 6PPD-q toxicity, with lethality (LC50) in response to exposure concentrations less than 0.1 parts per billion.[19] In the present study, 6PPD-q levels were likely to have exceeded this acute lethality threshold for coho across all storms by an order of magnitude. This is supported by published 6PPD-q measurements in runoff from the same source (SR520 elevated bridge) across nine separate rain events in 2017−2019,[4,19] including the October and December stormwaters collected for the dilution experiments in Figure 1C (Table S3).

Our current findings are the first demonstration of urban runoff-driven mortality in Chinook, and our sockeye results reinforce what are apparently stark differences in vulnerability across closely related salmonids. For example, whereas coho (*O. kisutch*) are highly sensitive,[19] several field and laboratory studies have shown that congeneric chum salmon (*O. keta*) are not.[10,13] Similar to chum, zebrafish (*Danio rerio*) and medaka (*Oryzias latipes*) appear relatively insensitive to 6PPD-q,[20,21] along with Arctic char (*Salvelinus alpinus*) and white sturgeon (*Acipenser transmontanus*).[12] Conversely, Brinkmann et al.[12] recently showed that brook trout (*Salvelinus fontinalis*), like coho, are also highly sensitive to the acutely lethal toxicity of 6PPD-q. Intriguingly, in the same study, the time to death for rainbow trout (*O. mykiss*) was intermediate, with mortality occurring over a more protracted timeline of a few days. On the basis of these initial findings, the Salmonidae appear to sort into roughly three categories of vulnerability to 6PPD-q acute toxicity: high (coho salmon and brook trout), low (chum and sockeye salmon, Arctic char), and intermediate (steelhead/rainbow trout, Chinook salmon).

In the context of threatened species management, the recent *O. mykiss* results are particularly noteworthy. In addition to being a model test organism in aquatic toxicology, rainbow trout are an important aquaculture species for recreational fishing.[22] In the western United States, several distinct population segments (or evolutionarily significant units) of ocean-migrating *O. mykiss* (steelhead) are currently listed for protection under the U.S. Endangered Species Act (ESA). Accordingly, freshwater and estuarine habitats critical for steelhead conservation and recovery have been designated across major metropolitan areas in the coastal and interior regions of California, Oregon, and Washington. The overlap between these recovery domains and the expanding transportation grid, at the watershed and basin scales, is extensive. The ESA requires that federal natural resource managers consider the impacts of federal actions on listed species, and stormwater contaminants (e.g., 6PPD-q) represent a habitat factor that was largely unknown to science when steelhead were listed.

For *O. mykiss*, the initial evidence suggests that life history plasticity (i.e., freshwater residence vs ocean migration) is not a determinant of susceptibility, albeit premised on two important assumptions: (1) Variation in genetics or husbandry/culture practices between the *O. mykiss* stocks used here and those sourced for Brinkmann et al.[12] did not influence observed toxicity, and (2) 6PPD-q was the causative agent for *O. mykiss* deaths here, thus facilitating a direct comparison of mortality across the two studies. Irrespective, more work is needed—particularly experimental designs that consider phenotypic and genetic differences across wild steelhead stocks. The intermediate and delayed nature of the mortality syndrome in steelhead and Chinook (relative to coho) also raises the potential significance of sublethal toxicity. The recent discovery of 6PPD-q should expedite functional studies of neurobehavioral and cardiorespiratory dysregulation, to match the consistently dominant features of the distress phenotype (e.g., surface swimming and gaping, loss of orientation and equilibrium).

Our findings also directly address the potential role of dilution in receiving waters, as a conventional management strategy for reducing toxic impacts to aquatic communities. Recent laboratory study designs[14−17] have used urban runoff from a relatively intensively trafficked arterial, in part as a strategy to establish a clear baseline of toxicity in fish and invertebrates prior to green infrastructure treatments to evaluate pollutant removal and improved organismal health. While this approach was useful for challenging bioinfiltration soil systems,[16,17] exposures to undiluted arterial roadway runoff are not necessarily representative of receiving water quality conditions in large rivers or lakes or in habitats downstream from a site-specific stormwater discharge. Field surveys have consistently demonstrated high rates of coho spawner mortality across all urban watersheds where the phenomenon has been studied closely.[11] Therefore, a protective role for dilution has (to date) seemed unlikely, given these indirect lines of evidence.[10,11] Consistent with this, arterial runoff was acutely lethal to juvenile coho salmon, even when diluted in 95% clean water. Additional factors working against "dilution as the solution" to the urban runoff mortality syndrome include the ubiquitous and diffuse nature of stormwater inputs to salmon habitats (e.g., serial and repeated discharges along migration corridors), ongoing climate change (i.e., reduced receiving water volumes), and the possibility of sublethal toxicity at the lower end of the dilution exposure range examined here. To address these factors, future studies can focus on a few related chemicals (antiozonants and associated transformation products, as opposed to whole urban runoff), using an extensive and established set of tools for studying cardiorespiratory and neurobehavioral toxicity in fish (e.g., Blair et al.[23]). These studies are needed to more precisely define sublethal toxicity thresholds in ESA-listed steelhead and Chinook and to better understand what appear to be striking sensitivity differences across closely related species of salmon, trout, and char.

Comment ID	Comment Text	Response
1	Are project updates via listserv provided in languages other than English? Is there an option for individuals to request updates in languages other than English? If so, which languages?	Email updates on the OMF South project are provided in English. At the bottom of every email are translated links to a translation services webpage where readers can request information in their language. Sound Transit fully translates notification mailers and online open houses into Spanish, Korean, and Russian (the three most common languages spoken in the study area after English). In addition, Sound Transit provided a fully translated guide to the Draft EIS that provided a similar level of information to the online open houses. These are intended to be physical handouts shared at public meetings and targeted community briefings.
2	How are language access services provided during open house and drop-in sessions? Are multi-lingual staff present?	As described in Appendix B, Public Involvement and Agency Coordination, of the Final EIS, interpreters for sign language, Spanish, Korean, and Russian were available at the in-person public meeting and hearing on October 24, 2023. For smaller public events, such as drop-ins or presentations to specific community groups, Sound Transit will arrange interpretation upon request. Staff can also access a language line for on-demand interpretation services, if needed, or follow up with someone requesting more information with the support of an interpreter.
3	Were language services provided for virtual public hearings? If so, how were they provided? (Break-out sessions in multiple languages, etc.?)Was a sign language interpreter present?	The virtual public hearings included live-captioning, sign-language interpretation, and simultaneous interpretation in Spanish, Korean, and Russian. The virtual hearings were hosted on Zoom, with on-screen and spoken instructions informing people how to tune into the appropriate audio channel on the Zoom Interpretation feature at the bottom of their screen. Information clarifying this has been added to Appendix B, Public Involvement and Agency Coordination.
4	Simple typo creates significant difference: Title VI (6), instead of Title IV (4)	The correction has been made in Appendix B of the Final EIS.
5	The project web page provides a Google translate feature at the bottom right hand corner of the home page where it blends with the rest of the page. It isn't highlighted or easily identified by bold color or font. This means LEP individuals must scan the entire, English-only, page before locating the translate option. Additionally, the "Select Language" drop-down feature is displayed exclusively in English, which means an LEP individual would have to be able to read English in order to identify that this feature offers translated languages. This is also the case for the "civil rights and complaints" link. How are LEP folx provided meaningful access to language services if they must navigate English-only language in order to identify where these services exist? Placing the "View in other languages" option at the top of	Thank you for your comment. This input has been shared with the Sound Transit web team for inclusion in future updates to the website.

FHWA (Communication ID 539007)		
Comment ID	**Comment Text**	**Response**
	the home page, in languages represented in the project area, would provide more meaningful LEP access. On the Title VI page, multiple languages are provided in the top right corner to guide LEP folx to information about the Title VI complaint process. How do LEP folx locate complaint information, in-language, on the home page?	
6	This appears to be exclusively a EJ analysis and not a Title VI analysis, It does not include all Title VI protected classes or analyze them individually. The analysis aggregates minority populations and includes low-income populations. EJ addresses distribution of high and adverse impacts on minority and low-income populations. EJ analytical standards also recommend aggregating minority populations. Title VI ensures nondiscrimination in programs and activities on the basis of race, color, and national origin (all races, all colors, all national origins) and does not consider low-income. Title VI analytical standards recommend each population be analyzed individually. The Minority Population Distribution maps look at the density of the aggregated minority population but does not evaluate if there is a specific community (race, color, national origin) present that may be disparately impacted.	Sound Transit published the Title VI Facility Equity Analysis in 2021, separate from the 2021 SEPA Draft EIS. It was prepared in compliance with Title VI of the Civil Rights Act (42 U.S. Code 200d), FTA Circular 4702.1B, and Sound Transit Resolution No. R2022-19. The report is available to the public on Sound Transit's web page: https://www.soundtransit.org/sites/default/files/documents/operations-and-maintenance-facility-south-title-iv-facility-equity-analysis-report-2021110.pdf. The Board considered the findings of the Facility Equity Analysis in its selection of the Preferred Alternative in December 2021. Sound Transit will be publishing an amendment to the report in mid-2024 that will consider project revisions since the original analysis. The amendment will be available to the Board and the public prior to the action to select the project to be built.
7	Indicates "translation assistance" was available during online hearings. Was this oral interpretation or written translation services? If it was translation (written) how was this accommodated in the virtual space? Were there break-out rooms offering translated captioning?	The OMF South Title VI Facility Equity Analysis was published separately from the Draft EIS in November 2021. The virtual public hearings included live-captioning, sign language interpretation, and simultaneous interpretation in Spanish, Korean, and Russian. The virtual hearings were hosted on Zoom, with on-screen and spoken instructions informing people how to tune into the appropriate audio channel on the Zoom Interpretation feature at the bottom of their screen.
8	Were in-language lunch groups provided oral-interpretation services or written translation services? May want to make a distinction between what type of services were provided.	Oral interpretation was provided at the in-language meal events.
9	Were translation (written) or interpretation (oral) services provided for open houses?	American Sign Language and oral interpretation were provided at in-person and virtual public hearings for 2021 Draft EIS and the 2023 Draft EIS. Translated materials (handouts and website information) were provided for all open houses. Other interpretation services have been advertised and provided upon request for open houses.
10	No information was provided regarding increases in freight traffic. If this is captured in the passenger car equivalents, please document that in the text.	The amount of freight traffic to and from the OMF site is anticipated to be minimal, particularly during the AM and PM peak hours, because deliveries would occur during off-peak hours. Therefore, freight traffic was not factored into the analysis. Section 4.2.1.1 of Appendix G1, Transportation Technical

FHWA (Communication ID 539007)		
Comment ID	**Comment Text**	**Response**
		Report, to the Final EIS has been updated to clarify this.
11	No discussion of heavy vehicle traffic increases and impacts.	The amount of freight traffic to and from the OMF site is anticipated to be minimal, particularly during the AM and PM peak hours, because deliveries would occur during off-peak hours. Therefore, freight traffic was not factored into the analysis. Section 4.2.1.1 of Appendix G1, Transportation Technical Report, to the Final EIS has been updated to clarify this.
12	I recommend using fatal and serious crash rates rather than collision rates. Regardless of the pandemic, K and A crashes have increased while total reported crashes have decreased. This assessment should assess what risks are being elevated due to the increases in traffic, both in aggregate and by type.	The City of Federal Way Transportation Impact Analysis guidelines requires total collision crash rates and only provide thresholds for high-collision locations based on total collisions. Therefore, total collision-crash rates were provided for all locations. There were also only two serious injury crashes in the entire study area and no fatal crashes, so K/A (fatal or disabling) crash rates will almost all be zero. Section 3.7.1 of Appendix G1, Transportation Technical Report, has been updated to reflect this. Additionally, while there are volume increases expected in the future, these are not because of the project. Because the project alternatives are not expected to result in impacts to traffic safety, it is not a differentiator among the alternatives.
13	The traffic safety changes experienced in 2020-2022 are realistic and should not be excluded. Exposure is accounted for by normalizing by VMT and EV. Traffic behavior has changed since 2018 and should be accounted for in decision-making.	The Final EIS relies on data from 2016 to 2018 because it provides a more conservative (higher) collision rate than data from 2020 and 2021, which reflect lower traffic volumes during the years of the COVID pandemic. Because the project alternatives are not expected to result in impacts to traffic safety, the collision data is not a differentiator among the alternatives.
14	Essential Fish Habitat should be capitalized throughout.	This revision has been made throughout the Final EIS.
15	2nd paragraph where study area extent defined, the 300' extent for pollutants isn't really consistent with conclusions in second paragraph of 3.10-13 where downstream adverse effects are acknowledged.	The description of the study area in Section 3.10, Ecosystem Resources, has been revised to explain that downstream impacts were also considered.
16	For the discussion on 6PPD-quinone where coho pre-spawn mortality is mentioned, consider expanding to include more recent science on mortality to other salmonids and trout including steelhead, Chinook salmon and rainbow trout (scientific sources provided).	The provided references have been summarized in Section 3.10, Ecosystems, and added to the reference section in Appendix A, Support Information, of the Final EIS.
17	Pg. 3.11-17: States that enhanced treatment for all post-project GIS will be provided. Does this include existing and replaced PGIS?	Yes, the project would provide treatment for existing and new pollutant-generating impervious surfaces that are part of the project, as required by local regulations.

FHWA (Communication ID 539007)		
Comment ID	**Comment Text**	**Response**
18	Table 3.11-10 shows either a net reduction or no increase in PGIS for the Preferred Alternative but later in the section (3.11.2.2) it states that OMF S. would add PGIS and non-PGIS.	The PGIS calculations were updated for the Final EIS. The updated numbers show an increase of 1.2 acres for the Preferred Alternative with the 40 mph Alignment. Please see Table 3.11-3 in the Final EIS with the updated analysis.
19	The Potential Mitigation (3.11.3) section states that no temporary or long-term adverse impacts on water resources are expected after treatment BMPs are constructed, however in the Ecosystems section, adverse effects downstream are acknowledged. I think it is valid to state that no further mitigation is likely to be required and explain that some adverse effects may occur due to the very low concentrations of some pollutants that are still deemed toxic to some fish species and the fact that even "effective" treatment won't prevent some discharges from the BMPs that may be above those thresholds.	The proposed stormwater management uses Ecology-approved BMPs that meet standards for all known, available, and reasonable methods of prevention, control, and treatment (abbreviated as AKART). Section 3.11, Water Resources, in the Final EIS was updated to note that it is possible that discharges from sites with approved stormwater management may release pollutants at low thresholds or low flows at durations that can still harm sensitive aquatic species for a period of time, due to the limitations of AKART. Nevertheless, these BMPs are expected to prevent long-term, adverse impacts to surface water and groundwater quality, and no additional mitigation is recommended.
20	There are two separate approval actions for FHWA and they should be called out separately on this list. There is an NEPA Record of Decision, Federal Highway Administration and the Air Space Lease for Use of Interstate Right of Way, Federal Highway Administration.	The suggested revision to the Fact Sheet has been made in the Final EIS.
21	FHWA wants to confirm there are no anticipated design approvals or modifications to Interstate 5 with this project, which would require FHWA approval.	The current design does not include modifications to I-5 that would require FWHA approval. If final design includes modifications, Sound Transit would apply for the necessary approvals.
22	The last paragraph in 3.6.3.1 indicates that EJ populations would accrue benefits through "the addition of new jobs to build the project." Given the way contractors are selected, there is no way to definitively say the jobs will be given to people in the vicinity of the project. Even with more lenient local hiring rules now, there is no guarantee and we would be more comfortable if this statement was left out—or include a caveat to the statement to explain that it is not a guarantee. Even though it should be obvious given the context, there should be an explanation that the benefits in the last paragraph of this section are all temporary benefits that would occur during construction. If there would be any kind of increased staffing in the area because of the maintenance facility, that could be added as a more permanent benefit related to the economic factors mentioned in this paragraph.	Section 3.6.3.1, Project Impacts and Benefits (to Environmental Justice, Social Resources, Community Facilities, and Neighborhoods), states that the benefits of job creation would be to all populations, including EJ populations. It does not include a statement that jobs would be given to the people in the vicinity of the project. Job creation would be both permanent for operations of the facility, which would employ approximately 610 people, as well as for temporary for construction. The text in Section 3.6.3.1 of the Final EIS has been revised to clarify this.
23	Please include the following (adding FTA if you deem appropriate): "An Executive Order (E.O.) 14096—Revitalizing Our Nation's Commitment to Environmental Justice for All has been recently enacted (April 21, 2023). The new E.O. 14096 on environmental justice does not rescind EO 12898, which FHWA is implementing through the current DOT and FHWA EJ Orders (DOT 5610.2C	Appendix E, Environmental Justice Assessment, of the Final EIS has been revised to acknowledge that EO 14096, Revitalizing Our Nation's Commitment to Environmental Justice for All, does not rescind EO 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, which FTA is implementing through

FHWA (Communication ID 539007)		
Comment ID	**Comment Text**	**Response**
	and FHWA 6640.23A) until further guidance is provided regarding the implementation of the new E.O. on environmental justice."	DOT Order 5610.2C until further guidance is provided regarding the implementation of EO 14096 on environmental justice.
24	It is difficult from any figure to see where the alternatives would intersect the interstate ROW and cross the access line. Does there need to be a figure with that?	The figure in Chapter 2 is intended to be a high-level representation of the project. Please see Appendix C, Conceptual Design Drawings and Engineering Information, which includes the WSDOT Compatibility Line and the I-5 right-of-way.
25	It was not stated in the noise analysis specifically but it may be helpful to the reader and existing residents that the reason why there are so few noise impacts from the new mainline extension and test track to the north is because properties will be acquired for the facility, thus there will be some distance between sensitive receptors and the track. This is not exactly clear as there is no map in the technical report that includes model receptor locations.	As discussed in Section 3.9, Noise and Vibration, the project noise level was determined based on project parameters, such as the speed of the trains, headways and hours of operation, and the distance to sensitive receptors from the tracks. Because several properties would be acquired for the project, and those would be the properties closest to the tracks, the distance between the receptors and tracks is greater than it would be otherwise. The projected noise level was then compared to the existing noise levels to determine whether there would be impacts. Section 3.9.2, Environmental Impacts, in the Final EIS has been updated for clarification. Appendix G2, Noise and Vibration Technical Report, includes figures that show noise impact locations and proposed mitigation associated with the 55 mph Design Option.
26	It is confusing to the reader that existing noise levels in both tables (specifically S 324th Street to Burning Tree Blvd) do not match. Checking this against tables G2.6-10 and G2.6-11 it looks like the difference is between NB and SB locations. Consider adding the track side column to Table 3.9-2 and 3.9-3.	Tables 3.9-2 and 3.9-3 of the Final EIS have been revised to add a column specifying the track side and the distance to the track.
27	"Sound Transit would replace noise walls and berms that would be removed as part of the Preferred And South 344th Street alternatives." State that this would specifically occur on I-5.	The suggested revision has been made to the Final EIS and to note that Sound Transit would conduct additional noise analysis, as needed, in coordination with WSDOT and Federal Way during final design.
28	It is difficult from any figure to see where the alternatives would intersect the interstate ROW and cross the access line. Does there need to be a figure with that?	The figure in Chapter 2 is intended to be a high-level representation of the project. Please see Appendix C, Conceptual Design Drawings and Engineering Information, which includes the WSDOT Compatibility Line and I-5 right-of-way.
29	Missing discussion that relocation resources are available to all people being relocated without discrimination in compliance with Sound Transit's Limited English Proficiency Plan.	Section 3.3.4, Sound Transit Acquisition and Relocation Policy Summary has been revised in the Final EIS to include reference to Sound Transit's Language Assistance Plan.
30	Displacement and relocation really mean the same thing. Displaced person is defined as any person who moves from the real property or moves his or her personal property from the real property. Relocation is provided to displaced persons. This section should really be titled Property Acquisitions and Displacements.	For the purposes of the OMF South EIS analysis, displacements are referring to businesses and residents that would be moved as a result of the project, and relocations are referring to opportunities for businesses, residents, and other property owners to relocate within the same general area. The heading title in the Final EIS has not been changed.

FHWA (Communication ID 539007)		
Comment ID	**Comment Text**	**Response**
31	This is really an FTA call however, if this were a WSDOT project, according to WSDOT's ROW manual, environmental reports at this level should not include parcel specific information such as names and possible addresses of potential displacements. This information, if collected, should be kept in a separate project file. The statements should be more general. Instead of calling out Belmor Mobile Home Park, just say mobile home park, GarageTown to storage units, etc..	The level of detail for the potentially affected parcels analysis is standard for Sound Transit projects. Providing this level of affected parcel information is appropriate because it provides adequate notification to potentially affected property owners and discloses the range of effects among project alternatives.
32	I wouldn't refer to this section as "Relocation Opportunities". The section is really talking about property availability for displacements so I would suggest using that title.	Please see response to Comment ID 30.
33	Since CoStar does not collect data on availability for potential replacement sites for religious facilities, what other data collection did you explore, e.g. real estate broker in the local market?	In addition to CoStar, Sound Transit used King County Assessor data and consulted web-based real estate companies for appropriately sized vacant land. Note that most of the potentially affected churches are in commercial or industrial buildings, which are common in the area.
34	This section states that finding properties that have specific needs may be more difficult to find. Missing a discussion of the actions proposed to remedy insufficient replacement sites.	As stated in Section 3.3, Acquisitions, Displacements, and Relocations, of the Final EIS, Sound Transit would follow the procedures outlined in its Property Acquisition and Relocation handbook. Qualified relocation agents are assigned to work with displaced persons throughout the process of locating replacement property and making the transition to the new location. The goal of the relocation agent is to assist the displaced person in locating a replacement site and successfully completing their move.
35	Title of section is "Single-Family Residential" and according the Table 3.3-1 under notes residential displacements include individual apartment/condo units and mobile homes. Based on this "Multi-Family should be added to the title.	The title of Section 3.3.3.2 has been changed to "Residential" in the Final EIS.
36	Suggest changing the sentence from saying displaced residents may have to find a location in a different neighborhood to "a similar neighborhood". A comp from either the same neighborhood or similar neighborhood considered in the same market must be provided to the displaced person before the agency can require them to relocate. Also, mobile home displacements can be challenging as inventory is at an all time low. This section is missing a discussion of the actions proposed to remedy insufficient replacement sites, including housing of last resort.	A different neighborhood was used because, while a comparable sale (comp) in a similar neighborhood would be provided, the resident may elect to move to a different neighborhood. Section 3.3.3.2 has been revised to describe different relocation options available for displaced Belmor residents.

FHWA (Communication ID 539007)		
Comment ID	**Comment Text**	**Response**
37	The first sentence is contradictory as prior sections stated that finding properties with unique characteristics, such has a religious facility, could be more challenging. Also, in the case of the Church on 25 acres, it can be difficult to relocate due to its size. Missing a discussion of the actions proposed to remedy insufficient replacement sites.	Section 3.3.3.3, Religious Facilities, states that there would generally be adequate space available in the study area because the facilities that would be displaced are in commercial or industrial buildings. It also acknowledges an exception to this is Christian Faith Center, which would be more challenging to relocate because of its size. Section 3.3.4, Sound Transit Acquisition and Relocation Policy Summary, summarizes the compensation and services Sound Transit provides. As part of its advisory services to those that are displaced, Sound Transit provides continuing and ongoing information related to available replacement sites as they arise.
38	Suggest changing “relocation opportunities” to “available properties”.	“Relocation opportunities” is the standard terminology Sound Transit uses in its EISs.
39	Not sure if Sound Transit’s procedures allow for the use of a waiver valuation but, if they are going to use a waiver valuation for the TCEs or any other right that fits the criteria then they will want to add waiver valuation discussion to this section.	Use of waiver valuation are typically determined during final design; therefore, they are not identified in the EIS.
40	2nd sentence needs to be changed as it states in addition to compensating owners which can provide the appearance that the additional compensation is only for owners. Since this sentence deals with relocation expenses it should be revised to state other forms of compensation for displacements could include…... Would also suggest changing “support services” to “advisory services”	The Final EIS has been revised to clarify the text per this comment.
41	Typically the property owner will approach the agency to request a hardship acquisition and that has a defined process. An agency can also acquire early when they have the legal right to do so. You might revise to state Sound Transit, with FTA’s approval is considering early acquisition of the four parcels associated with the church parcel, and it could potentially be acquired as a hardship acquisition if the church makes the request and provides the necessary documentation.	The text in Section 3.3.4, Sound Transit Acquisition and Relocation Policy Summary, states that hardship can be used when the property owner can document, based on health, safety, or financial reasons, that remaining in the property poses an undue hardship compared to others. FTA required this documentation to support their approval referenced in the text. The text in this section has been updated in the Final EIS to reflect the Sound Transit Board action to advance the early acquisition of the Christian Faith Center parcels.
42	This statement is incorrect and should be revised to include all displacements. I would suggest removing “Businesses and tenants” to “Displaced persons” since all (business, farm, NPO, PPO, and residential) are included as defined.	The Final EIS has been revised as suggested.
43	Advisory services are applicable to more than just property owners. Sentence should be revised – suggest just removing “to property owners”.	Section 3.3.5, Potential Mitigation Measures (Acquisitions, Displacements, and Relocations), has been updated in the Final EIS to reflect this suggestion.

FHWA (Communication ID 539007)		
Comment ID	**Comment Text**	**Response**
44	This is really an FTA call however, if this were a WSDOT project, according to WSDOT's ROW manual, environmental reports at this level should not include parcel specific information such as names and possible addresses of potential displacements. This information, if collected, should be kept in a separate project file. The statements should be more general. Instead of calling out Belmor Mobile Home Park, just say mobile home park, GarageTown to storage units, etc..	The level of detail for the potentially affected parcels analysis is standard for Sound Transit projects. Providing this level of affected parcel information is appropriate because it provides adequate notification to potentially affected property owners and discloses the range of effects among project alternatives.
45	This is really an FTA call however, if this were a WSDOT project, according to WSDOT's ROW manual, environmental reports at this level should not include parcel specific information such as names and possible addresses of potential displacements. This information, if collected, should be kept in a separate project file. The statements should be more general. Instead of calling out Belmor Mobile Home Park, just say mobile home park, GarageTown to storage units, etc..	Please see response to Comment ID 44.
46	Suggest changing "substitute" to "suitable" to be consistent with the other areas you reference suitable for business sites.	The text of the Final EIS has been revised.
47	This is really an FTA call however, if this were a WSDOT project, according to WSDOT's ROW manual, environmental reports at this level should not include parcel specific information such as names and possible addresses of potential displacements. This information, if collected, should be kept in a separate project file. The statements should be more general. 48	Suggest referring reader to the Acquisition and Displacements section for discussion on the difficulties associated with relocating a church.	The text of the Final EIS has been revised.

November 6th, 2023

Sound Transit, OMF South Project
c/o Erin Green, South Corridor Environmental Manager
401 S Jackson St., Seattle, WA 98104

RE: Operations & Maintenance Facility South, Draft EIS review

The Washington State Department of Transportation (WSDOT) is pleased to provide comments on the Draft Environmental Impact Statement (DEIS) for the Operations and Maintenance South (OMF South) Project.

Some key priorities from the attached Excel comment sheet are listed below:

1. Take inventory of WSDOT owned and managed facilities (i.e., noise walls, utilities, ITS) so we can work together to create avoidance and/or minimization and mitigation plans.
    a. Please also note the comments focused on maintenance access and plans. We anticipate these will be resolved through an Operations and Maintenance agreement.
2. The South 344th Street alternative shows impacts to a WSDOT BMP. Please coordinate with WSDOT to define any potential impacts and mitigation measures.
3. The WSDOT Triangle Project is mentioned multiple times. Please be aware that this project was recently shelved. Refer to the project website for more information.
4. Fish passage barriers are noted throughout the document. We recommend adding WDFW ID numbers and ownership when feasible to help differentiate between locations.
    a. Additionally, please utilize this link to access WSDOT's current 2030 fish passage delivery plan.
5. The 2019 Memorandum Of Understanding between Sound Transit and the Department of Ecology explains a difference between projects constructed by 2024 and projects constructed between 2030-2041. How will this apply to OMF South if complete by 2029?

Please contact Jessica Giblin, WSDOT Regional Transit Coordination Division (RTCD) environmental liaison, with any questions regarding this letter or the attached comment sheet.

WSDOT appreciates the opportunity to review and looks forward to continuing our collaboration with Sound Transit.

Sincerely,

Cordelia Crockett

Cordy Crockett WSDOT RTCD Director
crockec@wsdot.wa.gov

Sound Transit's Operations & Maintenance Facility South Project - Comments from WSDOT's Review of the Draft EIS

Comments Due 11/6/23. Contact Jessica Giblin with questions (giblinj@wsdot.wa.gov)

#	DEIS Chapter	Page	Comment	Reviewer
1	3.11	3.11-8	If the project sites include any WSDOT-managed stormwater facilities, please identify the WSDOT stormwater facilities by creating a summary table if necessary.	K. Shin
2	3.11	3.11-17	Please verify if the WSDOT Highway Runoff Manual should be included to consider LID Design.	K. Shin
3	3.10.1.1	3.10-1	The statement "Based on the anticipated high level of interest from Tribes…biologists conducted formal delineations of the OHWM of tributaries to Hylebos Creek" could be corrected. OHWM delineations are done because of state and federal regulatory requirements, not because of a project's public profile. Is this trying to say delineations were done outside of the study area? If so, suggest clarifying and explain the reasoning.	E. Pizzichemi
4	3.10.1.1	Figure 3.10	How are mature forest and native mature forest classified? Ex: Based on dbh of trees? Please help clarify by defining how these are measured.	E. Pizzichemi
5	3.10.1.1	3.10-5	Consider adding "… biologists evaluated the accessibility of the streams in the study area *to salmonids* …" or something similar for clarity.	A. Atkinson
6	3.10.1.3	3.10-8	Similar to comment 3, wetland delineations are not done to alleviate concern, they are done to satisfy federal and state regulatory requirements. The sentence about doing formal delineations because of co-manager concern is not necessary.	E. Pizzichemi
7	3.10.1.3	3.10-8	"The Corps is expected to issue a new rule that will revise the definitions of waters of the US in fall 2023." - Will this paragraph be updated based on this change?	A. Atkinson
8	3.10.2.3	3.10-30	Regarding the classification of impact types - Typically, temporary impacts would need to be less than a year. Saying that forested/woody vegetated wetlands would recover in decades doesn't seem to fit the definition of temporary or long-term temporary.	E. Pizzichemi
9	3.10.3	3.10-32	Please work with the Puyallup Tribe if you're considering mitigation in the Hylebos watershed as the PTOI appreciate large-scale restoration.	E. Pizzichemi
10	3.10.3	3.10-33	Recommend re-checking availability at the Upper Clear Creek mitigation bank again. It may not have space by the time this project gets to permitting. I know the Rule prefer ILF and Banks.	E. Pizzichemi
11	3.8		AQ, GHG Emissions: Include social cost of carbon per the CEQ's 2023 NEPA GHG.	L. Taylor
12	3.2	3.2-22	S 344th Street access appears to be through WSDOT's BMP. How will WSDOT's facility be impacted and then mitigated for? The capacity/function of the WSDOT pond at S.344th St. needs to be maintained. (also in Executive Summary page ES-11).	K. Hall, C. Winningham
13	2	2-8	Because vulnerable communities have been historically impacted by transportation-related projects, recommend providing a concise explanation about how you will "identify potential impacts to neighborhood/community cohesion." The report currently makes some generalizations, but it would be helpful to have more information.	D. Karolczyk
14	2	2-8	Recommend that the report explain how vulnerable communities (e.g., community of color, retirees, Limited English proficient persons), and low-income residing in South 344th Street Preferred Alternative would be impacted. This would give reassurance that protected groups under Title VI of the Civil Rights of 1964 are protected. For example, will this project adhere to the Right-of Way Uniform Act Relocation Assistance? How would this project carry out the relocation assistance advisory program to satisfy FHWA's requirements of Title VI of the Civil Rights Act of 1964 (42 U.S.C. 2000d et seq.)?	D. Karolczyk
15	3.1-3.6	3.6.11	Hazardous chemical exposure has been linked to many diseases (cancer, respiratory and heart diseases, among others). The Midway Landfill site is located in the middle of a residential area. If this alternative is chosen, how will the surrounding residents be protected during the cleaning of the site? Additionally, is there any information available to tell the reader what Midway's impact has been on the nearby residents and also the environment?	D. Karolczyk

#	DEIS Chapter	Page	Comment	Reviewer
16	2.5	2.32	In the cost comparison section, it might be worth mentioning that there is a test track in two alternatives, but not in the Midway Landfill option.	C. Crockett, D. Haight
17	Executive Summary	v	The table lists Temporary Construction Easement (SR 99, I-5). Since there probably won't be a lease on SR 99 for the OMF-S project, SR 99 can be removed from the parenthesis. Also, it is called a Temporary Construction Airspace Lease (TCAL) in this situation.	C. Crockett
18	3.15	85	No WSDOT utilities are listed here. Please check this area to confirm there are no stormwater facilities and/or ITS systems that belong to WSDOT.	C. Crockett
19			What would be the impacts to light rail service of building the midway option?	C. Crockett
20	3.7.2.4	21	5th bullet - Luminaires (light (lumen) in the air) is spelled incorrectly. Luminaries refers to people.	C. Winningham
21	Overall		Should state that WSDOT is a willing property seller for the at-grade portions and also a willing leaser for aerial sections, based on a successfully approved Compatibility Report.	D. Haight
22	Overall		If the OMF-S project is adding the work at S 324th then that area should be covered in the environmental document.	D. Haight
23	4.4.8	4-12	This does not discuss if there will be impacts to existing WSDOT noise walls. If so, Sound Transit must mitigate to the satisfaction of the City and replace removed WSDOT noise walls as necessary.	D. Haight
24	Executive Summary	ES-23	Acquisitions, Land Use, and Economics – “However, if the Midway Landfill Alternative were selected to be built, the residential displacements from mainline would still occur as a result of TDLE, subject to environmental review. Therefore, these displacements *could* ultimately occur regardless of which OMF S alternative is selected.” Should this ‘could’ be changed to ‘would’?	J. Giblin
25	Executive Summary	ES-26	Cumulative Impacts – “In addition, the COFW CCA Project and WSDOT Triangle Project are proposed adjacent to the Preferred and S 344th St alternatives. Both projects are in the early design phase, and neither have guaranteed (*construction)* funding.” Suggest adding in construction.	J. Giblin
26	Executive Summary	ES-29	Preferred and South 344th St Alternatives – “If the Board were to select *the* either the Preferred Alternative or South 344th St Alternative…” Suggest removing extra ‘the’.	J. Giblin
27	Throughout		The document states that OMF S will likely open in 2032. The public website ‘timeline and milestones’ page still states 2029. Suggest aligning. https://www.soundtransit.org/system-expansion/operations-maintenance-facility-south/timeline-milestones	J. Giblin
28	1	1-3	Infill stations are mentioned under 'central corridor'. What is an infill station? Consider defining.	J. Giblin
29	1 and 2 purpose and need		Midway Landfill Alternative: Mentions that public comments showed a heavy desire for this alternative. However, it seems that the landfill alternative doesn’t meet the purpose/need of the project. Was this communicated to the public that desired the Midway alternative? Can it be clarified in this document/will it be clarified in a future document why the Midway alternative is not an appropriate fit? This document explains that the Midway alternative has no impacts to homes, businesses, and low impacts to ecological resources, where the other alternatives have higher impacts to each of those resources. It would be helpful to include an explanation behind the reasoning for not going with the Midway Alternative.	J. Giblin, D. Haight
30	3.10	figures 3.10-1 and others	Wetlands and streams are shown in detail, so we suggest showing fish passage barriers with their WDFW IDs.	J. Giblin
31	3.10	3.10-16	Paragraph about a barrier but no number to define it. Could also state the owner.	J. Giblin
32	3.10	3.10-5	Mentions Federal Way City code stream type – suggest a table to show the code and the different corresponding categories.	J. Giblin
33	3.10	Table 3.10-1	Show buffers and consider adding which code is being followed (COFW, Kent, or state?).	J. Giblin

#	DEIS Chapter	Page	Comment	Reviewer
34	3.10	3.10-5	Mentions WSDOT developing plans to correct barriers. The Triangle Project (which was going to include these barriers) is now shelved, so this could be rephrased.	J. Giblin
35	3.10	3.10-9	Notes that the WSDOT 509 project previously delineated a wetland, but no source is provided. Should this report be cited?	J. Giblin
36	3.10	3.10.2.1	No build alternative – "FWLE will temporarily impact a wetland buffer within the Midway Landfill Alternative area." Isn't FWLE almost complete? Should this read 'FWLE temporarily *impacted* …"	J. Giblin
37	3.10	3.10-11	Mentions CWA Section 404 permit but does not specify regulatory agency that issues permit.	J. Giblin
38	3.10	3.10-130	"Under any of the build alternatives, runoff from impervious surfaces, including PGIS would be detained and treated in accordance with local, state, and federal requirements." Consider referencing the ST/Ecology 2019 MOU and any updates available since: https://www.soundtransit.org/st_sharepoint/download/sites/PRDA/FinalRecords/2019/Motion%20M2019-111.pdf	J. Giblin
39	3.11	3.11-9; 2.11.2.2	Long-term impacts – notes the 2019 MOU that calls out projects completed between 2030-2041. However, the MOU also says that projects completed by 2024 don't apply. It does call out TDLE as a project that will have to follow the MOU. OMF S was originally a part of TDLE, but it's not clear now where OMF S lies now in relation to this MOU. Could you explain where OMF S falls in relation to this MOU?	J. Giblin
40	3.11	3.11-1	BMP should be defined at first use.	J. Giblin
41	3.11	3.11-19	Preferred alternative – "…serves as an in-line stormwater detention facility." Suggested adding ownership here. Will you coordinate with the State or City if it's owned by another entity than ST?	J. Giblin
42	3.14	3.14-8	Public services, preferred alternative – "if the facility is relocated, some students would likely have to travel farther to school. If the school discontinues operations, the approximately 312 students would either need to enroll in another private school or enter the public school system." However, no mitigation is noted for this impact. Could you explain why nothing is needed here?	J. Giblin
43	4	Table 4.3-1	States that ST FWLE project will be completed in 2024. I believe this changed to 2026.	J. Giblin
44	4	Table 4.3-1	COFW CCA Project. Could add this has no construction funding. Could add more detail than TBD if desired to WSDOT Triangle Project (website says 'project suspended, no date for resumption scheduled').	J. Giblin
45	4	4-7	"In conjunction with this project, WSDOT is proposing to make fish passage improvements that would remove a portion of parking spaces in the FW/S 320th St Park & Ride. This would could start as early as 2024." Suggest defining which project (COFW CCA, ST OMF S, WSDOT Triangle) and adding WDFW ID numbers to help clarify. Also, the current schedule of these WSDOT barrier corrections can be verified using the 2030 plan here: https://wsdot.wa.gov/sites/default/files/2023-08/Env-FishPassage-KingSnohomishIsland-table.pdf.	J. Giblin

WSDOT (Communication ID 539078)

Comment ID	Comment Text	Response
1	Take inventory of WSDOT owned and managed facilities (i.e., noise walls, utilities, ITS) so we can work together to create avoidance and/or minimization and mitigation plans. a. Please also note the comments focused on maintenance access and plans. We anticipate these will be resolved through an Operations and Maintenance agreement.	After the Sound Transit Board selects the project to be built, Sound Transit staff will create a complete inventory of all WSDOT-managed facilities that could be potentially affected by the project to inform the development of an Operations and Maintenance agreement between the two agencies.
2	The South 344th Street alternative shows impacts to a WSDOT BMP. Please coordinate with WSDOT to define any potential impacts and mitigation measures.	Staff from Sound Transit and the consultant design team have had a series of meetings with WSDOT to discuss potential impacts to WSDOT's stormwater detention pond located near the southeast corner of the South 344th Street Alternative. If this alternative is selected as the project to be built, this coordination will continue.
3	The WSDOT Triangle Project is mentioned multiple times. Please be aware that this project was recently shelved. Refer to the project website for more information.	The Final EIS has been revised to reflect this comment.
4	Fish passage barriers are noted throughout the document. We recommend adding WDFW ID numbers and ownership when feasible to help differentiate between locations. a. Additionally, please utilize this link to access WSDOT's current 2030 fish passage delivery plan.	Thank you for the link to WSDOT's 2030 fish passage delivery plan. WDFW ID numbers and have been added to Figures 3.10-1 through 3.10-3.
5	The 2019 Memorandum Of Understanding between Sound Transit and the Department of Ecology explains a difference between projects constructed by 2024 and projects constructed between 2030-2041. How will this apply to OMF South if complete by 2029?	The footnote has been revised to correct the OMF South completion date to 2032.
6	If the project sites include any WSDOT-managed stormwater facilities, please identify the WSDOT stormwater facilities by creating a summary table if necessary.	Sound Transit will identify specific WSDOT stormwater facilities that could be affected during final design and coordinate with WSDOT as needed.
7	Please verify if the WSDOT Highway Runoff Manual should be included to consider LID Design.	Because OMF South is not a WSDOT facility, Sound Transit would not be required to follow WSDOT's Highway Runoff Manual, which provides guidance to direct the planning and design of stormwater management facilities for existing and new Washington State highways, rest areas, park-and-ride lots, ferry terminals, and highway maintenance facilities throughout the state. The Highway Runoff Manual establishes minimum requirements and provides uniform technical guidance in a similar manner to Sound Transit design standards and Ecology requirements.
8	The statement "Based on the anticipated high level of interest from Tribes…biologists conducted formal delineations of the OHWM of tributaries to Hylebos Creek" could be corrected. OHWM delineations are done because of state and federal regulatory requirements, not because of a project's public profile. Is this trying to say delineations were done outside of the study area? If so, suggest clarifying and explain the reasoning.	Formal surveyed delineations are not typically completed until after the NEPA/SEPA environmental review process has been completed, an alternative selected, and permit applications are being prepared. Sound Transit chose to survey ecosystem resources earlier in the process to both aid in design (thereby avoiding and/or minimizing impacts) and to inform the discussion with Tribes,

WSDOT (Communication ID 539078)		
Comment ID	**Comment Text**	**Response**
		resource agencies, and the public. The text of the Final EIS has been revised to clarify this.
9	How are mature forest and native mature forest classified? Ex: Based on dbh of trees? Please help clarify by defining how these are measured.	Appendix G2, Ecosystem Resources Technical Report, explains the difference between the forest vegetation types, which are non-native forest, mature native forest, and other native forest, following the WDFW vegetation classification system. Non-native forests are typically plantings of horticultural species as part of residential or commercial development. Mature native forest stands are generally over 80 years old, with trees exceeding 21 inches in diameter at breast height, on average (WDFW 2008). These forests are dominated by Douglas-fir, western redcedar, western hemlock, and black cottonwood and provide structurally complex habitat with more biological diversity and higher habitat value. The other native forest land cover type represents forests dominated by native tree species but lacking the defining features of mature forest.
10	Consider adding "… biologists evaluated the accessibility of the streams in the study area *to salmonids*…" or something similar for clarity.	This sentence in the Final EIS has been revised for clarity.
11	Similar to comment 3, wetland delineations are not done to alleviate concern, they are done to satisfy federal and state regulatory requirements. The sentence about doing formal delineations because of co-manager concern is not necessary.	See response to Comment ID 8.
12	"The Corps is expected to issue a new rule that will revise the definitions of waters of the US in fall 2023." – Will this paragraph be updated based on this change?	Effective September 8, 2023, EPA and the U.S. Army Corps of Engineers published their amendments to the Revised Definition of Waters of the United States. The Final EIS includes this update.
13	Regarding the classification of impact types – Typically, temporary impacts would need to be less than a year. Saying that forested/woody vegetated wetlands would recover in decades doesn't seem to fit the definition of temporary or long-term temporary.	Temporary impacts to forested wetlands that result in loss of trees are considered long-term temporary impacts because they can be restored over time. During permit review, resource agencies and Tribes may require specific mitigation to offset this loss.
14	Please work with the Puyallup Tribe if you're considering mitigation in the Hylebos watershed as the PTOI appreciate large-scale restoration.	Appendix B, Public Involvement and Agency Coordination, includes discussion of Sound Transit's outreach to the Puyallup Tribe of Indians and the Muckleshoot Indian Tribe regarding potential impacts to ecosystem resources.
15	Recommend re-checking availability at the Upper Clear Creek mitigation bank again. It may not have space by the time this project gets to permitting. I know the Rule prefer ILF and Banks.	The referenced statement in the Draft EIS was noting the existence of wetland mitigation banks and in-lieu fee programs that could be available for projects within the OMF South study area. Sound Transit would assess availability during the mitigation design and permitting process.
16	AQ, GHG Emissions: Include social cost of carbon per the CEQ's 2023 NEPA GHG.	The social cost of GHG emissions has been calculated for the Final EIS and is included in Section 3.8, Air Quality and Greenhouse Gas Emissions.
17	S 344th Street access appears to be through WSDOT's BMP. How will WSDOT's facility be impacted and then mitigated for? The capacity/function of the WSDOT pond	The main employee access for the South 344th Street Alternative is just west of the S 344th Street/18th Place S intersection. It would not impact WSDOT's stormwater pond near S 344th Street and I-5.

WSDOT (Communication ID 539078)		
Comment ID	**Comment Text**	**Response**
	at S.344th St. needs to be maintained. (also in Executive Summary page ES-11).	
18	Because vulnerable communities have been historically impacted by transportation-related projects, recommend providing a concise explanation about how you will "identify potential impacts to neighborhood/community cohesion." The report currently makes some generalizations, but it would be helpful to have more information.	This comment was made on Table 2.2-3, Evaluation Criteria, Measures, and Methods. The table describes the criteria used in the evaluation of the original 20 potential OMF South sites. The referenced OMF South Alternatives Evaluation Technical Memorandum describes the high-level assessment this criterion and others received to rank the original list of possible alternative sites. Sites that would alter major features and functions important to neighborhood/community cohesion or affect areas where low-income or minority populations are prevalent were assigned the number 1. A ranking of 2 meant that the site would alter some features and functions; 3 indicated that no features and functions would be affected. Once the sites were narrowed to the three analyzed in the Draft EIS during the SEPA scoping process, Sound Transit and FTA conducted a thorough assessment of impacts, which can be found in Section 3.6, Environmental Justice, Social Resources, Community Facilities, and Neighborhoods. Additional information can be found in Appendix E, Environmental Justice Assessment.
19	Recommend that the report explain how vulnerable communities (e.g., community of color, retirees, Limited English proficient persons), and low-income residing in South 344th Street Preferred Alternative would be impacted. This would give reassurance that protected groups under Title VI of the Civil Rights of 1964 are protected. For example, will this project adhere to the Right-of Way Uniform Act Relocation Assistance? How would this project carry out the relocation assistance advisory program to satisfy FHWA's requirements of Title VI of the Civil Rights Act of 1964 (42 U.S.C. 2000d et seq.)?	Please see response to Comment ID 18. Sound Transit published a Title VI Facility Equity Analysis independent of the EIS in November 2021. Prior to the Sound Transit Board action to select the project to be built, Sound Transit plans to publish an addendum to the Title VI Facility Equity analysis to reflect project changes since the 2021 analysis.
20	Hazardous chemical exposure has been linked to many diseases (cancer, respiratory and heart diseases, among others). The Midway Landfill site is located in the middle of a residential area. If this alternative is chosen, how will the surrounding residents be protected during the cleaning of the site? Additionally, is there any information available to tell the reader what Midway's impact has been on the nearby residents and also the environment?	Section 3.13, Hazardous Materials, includes information on the Midway Landfill, its Superfund status, the cleanup activities, and the ongoing monitoring actions. Potential impacts and proposed mitigation associated with removing materials from the landfill are also discussed.
21	In the cost comparison section, it might be worth mentioning that there is a test track in two alternatives, but not in the Midway Landfill option.	A footnote has been added to Table 2.5-1, Opinion of Probable Cost for Preliminary Engineering Design of the Build Alternatives, of the Final EIS to reflect this comment.
22	The table lists Temporary Construction Easement (SR 99, I-5). Since there probably won't be a lease on SR 99 for the OMF-S project, SR 99 can be removed from the parenthesis. Also, it is called a Temporary Construction Airspace Lease (TCAL) in this situation.	If the Midway Landfill Alternative is selected as the project to be built, this approval may be necessary for SR 99. The Fact Sheet for the Final EIS has been revised to state the correct title of the approval.

WSDOT (Communication ID 539078)		
Comment ID	**Comment Text**	**Response**
23	No WSDOT utilities are listed here. Please check this area to confirm there are no stormwater facilities and/or ITS systems that belong to WSDOT.	The analysis considers WSDOT stormwater facilities in Section 3.11, Water Resources. As WSDOT is not typically considered a utility provider, its facilities were not considered in Section 3.15, Utilities, Energy and Electromagnetic Fields, which addresses consumer-oriented utilities.
24	What would be the impacts to light rail service of building the midway option?	FWLE will be operational at the time of OMF South construction. If the Midway Landfill Alternative is selected as the project to be built, there would be some disruption of service in order to connect the lead tracks of the OMF to the mainline. Section 3.2.2.3, Construction Impacts (to Transportation), and Section 4.3.3.5 in Appendix G1, Transportation Technical Report, of the Final EIS have been revised to clarify this.
25	5th bullet -Luminaires (light (lumen) in the air) is spelled incorrectly. Luminaries refers to people.	The Final EIS has been revised to reflect this comment.
26	Should state that WSDOT is a willing property seller for the at-grade portions and also a willing leaser for aerial sections, based on a successfully approved Compatibility Report.	The Final EIS acknowledges WSDOT's role as a potential property seller and leaser. Sound Transit appreciates WSDOT's cooperation on this project and looks forward to continuing to coordinate through project design and construction.
27	If the OMF-S project is adding the work at S 324th then that area should be covered in the environmental document.	The project study area used for analysis in the Draft EIS covers the entire geographic area potentially affected by the proposed OMF South. The City of Federal Way is preparing separate environmental documentation for the City Center Access project at S 324th Street.
28	This does not discuss if there will be impacts to existing WSDOT noise walls. If so, Sound Transit must mitigate to the satisfaction of the City and replace removed WSDOT noise walls as necessary.	Potential impacts to noise walls are discussed in Final EIS Section 3.9, Noise and Vibration, under Section 3.9.2.2, Long-Term Impacts, Preferred Alternative.
29	Acquisitions, Land Use, and Economics – "However, if the Midway Landfill Alternative were selected to be built, the residential displacements from mainline would still occur as a result of TDLE, subject to environmental review. Therefore, these displacements could ultimately occur regardless of which OMF S alternative is selected." Should this 'could' be changed to 'would'?	The use of "could" in this case is correct, as an OMF South alternative has not yet been selected for construction and TDLE has not completed its environmental review and includes consideration of a No-Build Alternative.
30	Cumulative Impacts – "In addition, the COFW CCA Project and WSDOT Triangle Project are proposed adjacent to the Preferred and S 344th St alternatives. Both projects are in the early design phase, and neither have guaranteed (construction) funding." Suggest adding in construction.	The Final EIS has been revised to reflect this comment.
31	Preferred and South 344th St Alternatives – "If the Board were to select the either the Preferred Alternative or South 344th St Alternative…" Suggest removing extra 'the'.	The Final EIS has been revised to reflect this comment.
32	The document states that OMF S will likely open in 2032. The public website 'timeline and milestones' page still states 2029. Suggest aligning. https://www.soundtransit.org/system-expansion/operations-maintenance-facility-south/timeline-milestones	The project website has been updated to reflect a forecasted in-service date of 2032. Consistent with the EIS, it also states that Sound Transit is pursuing measures to advance the opening earlier. Additionally, if the Midway Landfill Alternative is selected to be built the

WSDOT (Communication ID 539078)		
Comment ID	**Comment Text**	**Response**
		opening date would be between 2035 and 2037, depending on the subsurface construction design option.
33	Infill stations are mentioned under 'central corridor'. What is an infill station? Consider defining.	An infill station is a new station built on an existing light rail line. This definition has been added to the Final EIS.
34	Midway Landfill Alternative: Mentions that public comments showed a heavy desire for this alternative. However, it seems that the landfill alternative doesn't meet the purpose/need of the project. Was this communicated to the public that desired the Midway alternative? Can it be clarified in this document/will it be clarified in a future document why the Midway alternative is not an appropriate fit? This document explains that the Midway alternative has no impacts to homes, businesses, and low impacts to ecological resources, where the other alternatives have higher impacts to each of those resources. It would be helpful to include an explanation behind the reasoning for not going with the Midway Alternative.	The 2021 Draft EIS and 2023 NEPA Draft/SEPA Supplemental Draft EIS and related community engagement materials identify the tradeoffs of the alternatives studied in the EIS. This includes identifying the schedule, cost, and transit impacts of the Midway Landfill Alternative. The Sound Transit Board identified the South 336th Street Alternative as the Preferred Alternative in 2021. The Preferred Alternative represents a preference based on information currently available. After the Final EIS is published, the Board will consider the Draft EIS public comments, Final EIS analysis, and other factors prior to the selection of the project to be built.
35	Wetlands and streams are shown in detail, so we suggest showing fish passage barriers with their WDFW IDs.	The Final EIS has been revised to include the WDFW fish passage barrier ID numbers.
36	Paragraph about a barrier but no number to define it. Could also state the owner.	The Final EIS has been revised to add the WDFW ID number (933224) and ownership (City of Federal Way) for the culvert described.
37	Mentions Federal Way City code stream type – suggest a table to show the code and the different corresponding categories.	Since all of the streams described in the Final EIS are considered Type F for potential fish habitat, a new table has not been added. The city of Federal Way has adopted Washington Department of Natural Resources' water typing system in its entirety. The Final EIS has been updated to refer to the appropriate city code section for stream typing for the reader's reference.
38	Show buffers and consider adding which code is being followed (COFW, Kent, or state?).	Potential long-term impacts to stream buffers are included in Table 3.10-1, and potential construction-related stream buffer impacts are listed in Table 3.10-5. As the Midway Landfill Alternative has no stream impacts, all potential impacts identified in the Final EIS are in Federal Way.
39	Mentions WSDOT developing plans to correct barriers. The Triangle Project (which was going to include these barriers) is now shelved, so this could be rephrased.	The text of the Final EIS in Section 3.10, Ecosystem Resources, has been revised to reflect this comment.
40	Notes that the WSDOT 509 project previously delineated a wetland, but no source is provided. Should this report be cited?	Wetland WL148.67L is a small, depressional wetland located in the WSDOT right-of-way of southbound I-5. It was delineated in April 2019 by Anchor QEA as a component of the SR 509 Completion Stage 1B Project (Anchor 2019). The reference has been added to the Final EIS.
41	No build alternative – "FWLE will temporarily impact a wetland buffer within the Midway Landfill Alternative area." Isn't FWLE almost complete? Should this read 'FWLE temporarily impacted…"	The comment is correct, and the Final EIS has been revised.

WSDOT (Communication ID 539078)		
Comment ID	**Comment Text**	**Response**
42	Mentions CWA Section 404 permit but does not specify regulatory agency that issues permit.	The Anticipated or Potential Licenses, Permits, and Approvals in the Fact Sheet identifies the U.S. Army Corps of Engineers as the issuing agency of the CWA Section 404 approval.
43	"Under any of the build alternatives, runoff from impervious surfaces, including PGIS would be detained and treated in accordance with local, state, and federal requirements." Consider referencing the ST/Ecology 2019 MOU and any updates available since: https://www.soundtransit.org/st_sharepoint/download/sites/PRDA/FinalRecords/2019/Motion%20M2019-111.pdf	Section 3.11, Water Resources, includes a footnote summarizing the memorandum of understanding (MOU) between Ecology and Sound Transit.
44	Long-term impacts – notes the 2019 MOU that calls out projects completed between 2030-2041. However, the MOU also says that projects completed by 2024 don't apply. It does call out TDLE as a project that will have to follow the MOU. OMF S was originally a part of TDLE, but it's not clear now where OMF S lies now in relation to this MOU. Could you explain where OMF S falls in relation to this MOU?	Sound Transit is considering OMF South as a project covered by the MOU.
45	BMP should be defined at first use.	The first use of BMP in the document is in Section 3.2, Transportation, where it is defined.
46	Preferred alternative – "…serves as an in-line stormwater detention facility." Suggested adding ownership here. Will you coordinate with the State or City if it's owned by another entity than ST?	The facility is owned by Federal Way and has been the subject of ongoing coordination between the city and Sound Transit.
47	Public services, preferred alternative – "if the facility is relocated, some students would likely have to travel farther to school. If the school discontinues operations, the approximately 312 students would either need to enroll in another private school or enter the public school system." However, no mitigation is noted for this impact. Could you explain why nothing is needed here?	As a business, the Pacific Christian Academy would be eligible for relocation assistance if the Preferred Alternative is selected as the project to be built. Based on recent coordination with Pacific Christian Academy, it is anticipated that the school would relocate. If that is not possible, there are several other private Christian schools in south King County, including Evergreen Christian in Federal Way and Seattle Christian in SeaTac.
48	States that ST FWLE project will be completed in 2024. I believe this changed to 2026.	The completion date for FWLE has been updated to 2026 in the Final EIS.
49	COFW CCA Project. Could add this has no construction funding. Could add more detail than TBD if desired to WSDOT Triangle Project (website says 'project suspended, no date for resumption scheduled').	The suggested revisions have been made to Table 4.3-1 of the Final EIS.
50	"In conjunction with this project, WSDOT is proposing to make fish passage improvements that would remove a portion of parking spaces in the FW/S 320th St Park & Ride. This would could start as early as 2024." Suggest defining which project (COFW CCA, ST OMF S, WSDOT Triangle) and adding WDFW ID numbers to help clarify. Also, the current schedule of these WSDOT barrier corrections can be verified using the 2030 plan here: https://wsdot.wa.gov/sites/default/files/2023-08/Env-FishPassage-KingSnohomishIsland-table.pdf.	Information regarding culvert ID numbers and ownership related to Federal Way's City Center Access Project has been added to Table 4.4-1 of the Ecosystem Resources section of Chapter 4, Cumulative Effects Analysis, of the Final EIS.

RE: Sound Transit Operations and Maintenance Facility – South NEPA/SEPA Supplemental DEIS City of Federal Way Technical Review Comments

Dear Ms. Fletcher and Mr. Weinberg,

Thank you for the opportunity to review and comment on the Draft Environmental Impact Statement (DEIS) for the Operations and Maintenance Facility South (OMF South). As you are aware, two of three sites that Sound Transit is considering are within the City of Federal Way. We have appreciated the collaborative nature of the relationship Sound Transit staff looks to have with the City.

The City has taken an official position on the OMF South in the previous SEPA DEIS and in a previously provided letter signed by the Mayor and full City Council dated April 6, 2021, and technical comment letter dated April 19, 2021. Both letters and supplemental comments are attached with this letter and are still valid and incorporated by reference.

CITY OF
Federal Way

Jim Ferrell, Mayor

Alternatives Considered

Page 2-16

- How can environmental impacts from TDLE be considered part of the "no-build" alternative if TDLE does not have an approved environmental document?

Transportation Impacts

The Following Comments are related to the main EIS document and pertain to transportation impacts.

Page 3.2-8

- 20th Avenue S is listed incorrectly as 20th Avenue E. Please address.

Page 3.2-12

- Historical collision date was collected between January 2016 to December 2018. This should be updated with more current data.
- Intersections with a collision rate above 1.0 per MEV will need to be discussed in greater detail as to potential contributing factors.
- Additionally, the societal cost per MEV must be provided in the collision summary tables and discussed.

Page 3.2-13

- It is noted that the annual growth rate is based on the growth rate used for TDLE traffic studies, but please specify what the basis for the assumed TDLE annual growth rate was. Typically, a higher annual growth rate closer to 1.25 percent has been used in the City of Federal Way.
- Was this signal timing optimization vetted with WSDOT and/or City of Federal Way? Are there other external factors outside of the study area that would impact the ability to optimize the signal timings?

Page 3.2-14

- Routes 177 and 577 would still be faster than light rail for several years, so there will be opposition to discontinuing those routes.

Page 3.2-16

- A more comprehensive trip generation section needs to be provided in this report. The appendices do not include detailed calculations and the methodology outlined here does not match with the methodology outlined in the appendices (i.e. trip generation does not appear to account for delivery-related trips or other non-employee trips).

- Given that this is a long-range analysis, and that the evaluated alternatives result in major changes to the roadway network, it is not appropriate to base trip distribution assumptions on existing travel patterns alone. Trip distribution patterns should be based on the regional travel model and adjusted as needed based on changes to the roadway network.

Page 3.2-17

- It cannot be definitely stated that no new safety issues would be introduced and no existing safety issues would be exacerbated. Particularly given the elimination of north-south connectivity for non-motorized traffic in the South 344th Street Alternative.

- The City of Federal Way's street vacation process should be referenced as it relates to the currently proposed roadway network and potential ongoing coordination.

Page 3.2-18

- The description of the new 18th Avenue S intersection is not consistent with the provided site plan. The description and if applicable, the associated analysis, should be updated.

- Parking study needs to be updated from the FWLE EIS to be consistent with ability to remove stalls without replacement.
  Does this include stalls removed for S324th culvert and roadway grade construction?

Page 3.2-19 – Table 3.2-6

- v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.

- Intersection 10 (SR 99/Driveway) is no longer proposed as part of the preferred alternative.

- Additional new intersections and site access points are not included in the analysis and are not summarized in Table 3.2-6. All new site driveways and new intersections resulting from roadway extensions must be provided in this table.

Page 3.2-20 – Table 3.2-7

- v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.

- 55 seconds of delay would typically indicate LOS E conditions. Without Synchro worksheets provided, it cannot be definitely confirmed that there are no impacts at this intersection. Please clarify.

- Intersection 10 (SR 99/Driveway) is no longer proposed as part of the preferred alternative.

- Additional new intersections and site access points are not included in the analysis and are not summarized in Table 3.2-7. All new site driveways and new intersections resulting from roadway extensions must be provided in this table.

Page 3.2-21 and page 3.2-25 - Figure 3.2-7 and Figure 3.2-8

- This figure should indicate the new roadway extensions that are part of the preferred alternative. Additionally, new intersections and site driveways must be included in the analysis and shown on the figure.

Page 3.2-22

- The City of Federal Way's street vacation process should be referenced as it relates to the currently proposed roadway network and potential ongoing coordination.

Page 3.2-23 and page 3.2-24 - Table 3.2-8 and Table 3.2-9

- v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.

- If volume projections are included for intersection 10 (as shown on the previous figures), then the traffic operations results should be shown in this table.

Page 3.2-26

- This would have a significant impact as a north-south bicycle connection would not be possible and the majority of injury-related crashes involved ped and cyclists along SR 99.

Page 3.2-32 – Table 3.2-13

- S 330th St is inappropriate for a haul route, as it is narrow, has a small traffic circle at 20th Ave S, and traverse's residential areas with some areas of high parking utilization.

Page 3.2-13

- In addition to the impacts of truck activity, the impacts of trips related to workers traveling to and from the site should be quantified and discussed.
- Please clarify how many workers would be traveling to and from the site and if there would be sufficient parking on-site for all workers to park.

Page 3.2-35

- S 330th St is not an acceptable haul route.

Page 3.2-42

- Consistent with the executive summary, the City's street vacation process should be referenced as an ongoing coordination effort related to the reconfiguration of the street network for both Federal Way alternatives.

The following comments are related to Appendix C

Page 1

- Additional support information is needed related to access for the proposed driveways for the midway landfill alternative. Support information for the proposed driveway widths and geometry is needed. Channelization and median improvements are needed on Pacific Hwy to support the new accesses.

Page 11

- The location of the track over/across the parking lot may impact the existing parking lot illumination. Evaluation and potential mitigation are needed as necessary.

Page 12

- The location of the track over/across the parking lot may impact the existing parking lot illumination. Evaluation and potential mitigation are needed as necessary.
- Location of track over/across S 322nd St may impact driver visibility of existing traffic signal at S 322nd St/23rd Ave S intersection. Evaluate and mitigate, if needed.
- Location of track over/across 23rd Ave S may impact driver visibility of traffic signal at S 322nd St/23rd Ave S intersection. Evaluate and mitigate, if needed.

Page 15

- Set gate further from 24th Ave S so that access ST maintenance vehicles can pull completely out of the roadway when opening the gate.
- Clarity is needed for a section of asphalt shown on the plans along 24th Avenue S near S 333rd St.

Page 16

- A proposed column is shown within the intersection of Winged Foot Way and Burning Tree Blvd. A revised location shall be provided.

Page 17 and Page 19

- Adjustment to the location of the proposed sidewalk, curb, and landscape strip for 24th Ave S is required.

Page 22

- Adjustment is needed for the access to the WSDOT stormwater facility at 21st Ave S and S 344th St. Update design to represent the intended roadway curve. Revise the access to driveway standards.

Page 25

- A 10-foot clear zone is required from roadway edge to face of proposed retaining walls.

Page 27

- On-street parking is shown along the proposed 18th Place S. On-street parking is allowed provided that it is outside the prescriptive sight triangle of the intersection and does not result in impacts to adjacent critical areas.

- S 341st Place is incorrectly shown as S 340th St. Please correct.

Page 34

- The location of the track over/across the parking lot may impact the existing parking lot illumination. Evaluation and potential mitigation are needed as necessary.

Page 37

- More evaluation is needed for access needs for existing properties adjacent to the proposed S 344th St Site alternative.

- Additional sidewalk connectivity is needed for a portion of the removed S 341st Place.

The following comments are related to Appendix G1

Overall Comments:

The analysis provided does not adequately analyze the preferred and 344th Street alternatives as not all new driveways/intersections are included and/or incorrect driveways are included. Additionally, v/c must be recorded for all intersections including those along State Routes as the City of Federal Way controls these intersections.

There is insufficient information provided related to the existing land uses removed and traffic rerouted as a result of vacated streets. Supplemental trip generation analysis and volume figures should be provided to illustrate how these conditions impact the future volumes.

Without this information it is not possible to validate the future volumes provided.
Additional attachments must be provided including detailed trip generation information for the OMF South site and existing land uses; traffic counts; and Synchro worksheets.

An updated parking analysis for the WSDOT 320th/23rd Ave park and ride needs to be completed to support removal of parking spaces consistent with the FWLE EIS that assumed use of this park and ride for LINK/Regional Transit riders.

Page G1-i

- The summary states that impacts may occur if the delay in an LOS F condition is worsened by more than 10 seconds. Please clarify the basis for this standard as it is not specified in Attachment A. Additionally, the City of Federal Way standards should be referenced here since they are based on v/c rather than LOS/delay.

Page G1-3 – Figure G1.1-2

- The extension of 18th Place S is described as intersection S 336th Street as the fourth (NB) leg of the 18th Ave S/S 336th St intersection, but the conceptual site plan does not depict it in this way due to the creek. It is assumed that a four-leg intersection is not feasible here and therefore the description/analysis should be revised accordingly.

Page G1-20

- In section 3.2.3 Traffic Volumes, please clarify what "as applicable" means for the adjusted 2022 traffic volumes. For instance, was volume balancing between intersections a key factor?

Page G1-21 – Figure G1.3-7

- During the AM peak hour, existing volumes at intersections 6 and 9 have decreased as compared to the 2021 DEIS resulting in greater volume imbalances between intersections in some cases. Please explain the change from the 2021 DEIS to the 2023 ADEIS.

Page G1-29, G1-31, G1-58, and G1-60 – Table G1.3-9, Table G1.3-11, Table G1.4-1, and Table G1.4-3

- v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.

Page G1-44

- Under section 3.7 Safety, while it is acceptable to use collision data from 2016 to 2018 because collision data during the pandemic was atypical, many studies have found that collision rates were higher during the pandemic. Therefore, it may not be accurate to say that 2016 to 2018 collision data is more conservative.

Page G1-55

- Intersections with a collision rate above 1.0 per MEV will need to be discussed in greater detail as to potential contributing factors.

  Additionally, the societal cost per MEV must be provided in the collision summary tables and discussed.

Page G1-54

- Under section 4.1.1.2 Traffic Volumes, it is noted that the annual growth rate is based on the growth rate used for TDLE traffic studies, but please specify what the basis for the assumed TDLE annual growth rate was. Typically, a higher annual growth rate closer to 1.25 percent has been used in the City of Federal Way.

Page G1-55

- In the 2042 PM analysis there is a mention of a decrease in delay due to signal optimization. Was this signal timing optimization vetted with WSDOT and/or City of Federal Way? Are there other external factors outside of the study area that would impact the ability to optimize the signal timings? Additionally, you cannot look at one SR-99 intersection in a vacuum as the entire corridor is coordinated.

Page G1-68

- Given that this is a long-range analysis, and that the evaluated alternatives result in major changes to the roadway network, it is not appropriate to base trip distribution assumptions on existing travel patterns along. Trip distribution patterns should be based on the regional travel model and adjusted as needed based on changes to the roadway network.

Page G1-69

- A more comprehensive trip generation sections needs to be provided in this report. The appendices do not include detailed calculations and the methodology outlined here does not match with the methodology outlined in the appendices (i.e. trip generation does not appear to account for delivery-related trips or other non-employee trips).

Page G1-70

- Under section 4.2.1.5 Parking, please specify the approximate number of parking spaces this represents for each alternative.

Page G1-71

- Under section 4.2.1.6 Safety, this section should address the intersections with a collision rate over 1.0 collisions per MEV and discuss how the project may impact these locations. Additionally, if north-south non-motorized facilities would not be feasible as part of the 344th Street Alternative, safety would not improve for non-motorized users and could in fact worsen. Please elaborate.

Page G1-72

- The City of Federal Way's street vacation process should be referenced for both City of Federal Way alternatives as it relates to the currently proposed roadway network and potential ongoing coordination.

- In section 4.2.2.1 regarding the extension of 18th Place S there is a section indicating that it would convert the existing S 336th St/18th Avenue S intersection into a four-legged intersection. This is not consistent with the provided site plan. The description and if applicable, the associated analysis should be updated.

- Information regarding existing land uses to be removed and associated trip generation projections for those uses need to be provided in section 4.2.2.2 Traffic Volumes.

Page G1-73 – Figure G1.4-7

- In addition to trip assignment, trip distribution figures should be included. Alternatively, trip distribution percentages could be illustrated on this figure (Figure G1.4-7).

- This figure should indicate new roadway extensions that are part of the preferred alternative.

- This figure shows intersection 10 as a new intersection, but intersection 10 no longer exists as part of the preferred alternative site plan based on Figure G1.1-2 and the roadway network description. If this driveway no longer exists, the volumes going through this intersection would need to be routed to other site access points and other study area intersections.

  Additionally, this figure does not show intersection 11 (18th Place S Extension/S 336th Street), but intersection is included in the LOS tables. Finally, the intersections of 21st Avenue S/S 341st Place and 21st Avenue S Extension/S 344th Street should be included in the analysis as well as future volume figures.

Overall, the analysis provided does not sufficiently analyze the operational impacts of the preferred alternative.

Page G1-74 – Figure G1.4-8

- This figure should indicate new roadway extensions that are part of the preferred alternative.

- This figure shows intersection 10 as a new intersection, but intersection 10 no longer exists as part of the preferred alternative site plan based on Figure G1.1-2 and the roadway network description. If this driveway no longer exists, the volumes going through this intersection would need to be routed to other site access points and other study area intersections.

  Additionally, this figure does not show intersection 11 (18th Place S Extension/S 336th Street), but intersection is included in the LOS tables. Finally, the intersections of 21st Avenue S/S 341st Place and 21st Avenue S Extension/S 344th Street should be included in the analysis as well as future volume figures.

  It is also not clear how the rerouted vehicles from roadway closures are accounted for. For example, the no-build conditions show 85 vehicles exiting 20th Avenue S during the PM peak hour. However, there are only 15 additional right turns at intersection 1 and no additional left turns beyond project trips. While volumes for intersection 11 are not shown, based on the future volumes at intersection 1, it does not appear that additional trips are routed to intersection 11. If these trips would no longer exist due to land uses being removed, it is not clear from this analysis as no trip generation fore existing land uses to be removed is provided. A figure showing how existing traffic was removed and rerouted should be included.

  Overall, the analysis provided does not sufficiently analyze the operational impacts of the preferred alternative.

Page G1-75 – Table G1.4-10

- Intersection 10 (SR 99/Driveway) is longer proposed as part of the preferred alternative.

- v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.

- Additional new intersections and site access points are not included in the analysis and are not summarized in Table G1.4-10. All new site driveways and new intersections resulting from roadway extensions must be provided in this table.

Page G1-76 and G1-78 – Figure G1.4-9 and Figure G1.4-10

- This figure should indicate the new roadway extensions that are part of the preferred alternative. Additionally, new intersections and site driveways must be shown on the figure.

Page G1-77 – Table G1.4-11

- 55 seconds of delay would typically indicate LOS E conditions. Without Synchro worksheets provided, it cannot be definitely confirmed that there are no impacts at this intersection. Please clarify.

- Intersection 10 (SR 99/Driveway) is longer proposed as part of the preferred alternative.

- v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.

- Additional new intersections and site access points are not included in the analysis and are not summarized in Table G1.4-10. All new site driveways and new intersections resulting from roadway extensions must be provided in this table.

Page G1-79

- In section 4.2.2.6 Nonmotorized Facilities, it should be more clearly defined where and what bicycle and pedestrian improvements are proposed as part of the preferred alternative.

- In section 4.2.2.8 Safety, the safety section should address if the project would impact intersections that already have a crash rate greater than 1.0 collisions per MEV.

Page G1-80

- In section 4.2.3.2 Traffic Volumes, information regarding existing land uses to be removed and associated trip generation projections for those uses need to be provided in this section.

Page G1-81 – Figure G1.4-11

- In addition to trip assignment, trip distribution figures should be included. Alternatively, trip distribution percentages could be illustrated on this figure (Figure G1.4-11).

Page G1-82 – Figure G1.4-12

- Intersection 10 is mislabeled for both AM and PM peak hours.
- If Intersection 1 is only providing access to the Christian Faith Church under build conditions, and little to no project trips are projected it is unlikely that this intersection would observe as much traffic as it does today. This analysis does not sufficiently account for (or sufficiently document) traffic that would be rerouted from 20th Avenue S due to the closure. As such, this analysis may not adequately consider additional impacts along SR 99 or 16th Street as a result. More broadly, a figure showing how existing traffic was removed and rerouted should be included.

Page G1-83 and G1-85 – Table G1.4-12 and Table G1.4-13

- If volume projections are included for intersection 10 (as shown on the previous figures), then the traffic operations results should be shown in this table.
- v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.

Page G1-84 – Figure G1.4-13

- If volume projections are included for intersection 10 (as shown on the previous figures), then the traffic operations results should be shown on this figure (Figure G1.4-13).

Page G1-86 – Figure G1.4-14

- If volume projections are included for intersection 10 (as shown on the previous figures), then the traffic operations results should be shown on this figure (Figure G1.4-14).

Page G1-87

- In section 4.2.3.6 Nonmotorized Facilities, if the alternative eliminates the greenway between S 336th Street and S 344th Street this would have a significant impact as a north-south bicycle connection would not be possible and the majority of injury-related crashes involved pedestrians and cyclists along SR 99.

Page G1-88

- In section 4.2.3.8 Safety, the safety section should address if the project would impact intersections that already have a crash rate greater than 1.0 collisions per MEV. Additionally, this section should address non-motorized safety impacts associated with eliminating a north-south non-motorized connection.

Page G1-99

- In section 4.3.11 Estimation of Construction Truck Traffic, in addition to the impacts of truck activity, the impacts of trips related to workers traveling to and from the site should be quantified and discussed.

Page G1-104

- In section 4.3.1.6 Impacts to Nonmotorized Facilities, please clarify how long north-south connectivity would be impacted as pedestrians and cyclists would shift to SR 99 under this scenario.

Page G1-105

- In Section 4.3.1.7 Impacts to Parking, please clarify how many workers would be traveling to and from the site and if there would be sufficient parking on-site for all workers to park.

Page G1-122

- In section 4.7 Long Term Mitigation Measures, consistent with the executive summary, the City's street vacation process should be referenced as an ongoing coordination effort related to the reconfiguration of the street network.

Social Resources, Community Facilities, and Neighborhoods

Page 3.6-8

- Belmor is a manufactured home community, zoned multifamily residential.

- Clarification is needed on the expected displaced residences. Provide methodology for calculating impacted residents and provide addresses.

- What analysis went in to this conclusion? Airtime Aviation, Inc. is located in a custom-designed building for the use. The impact to this business and others like it is inadequately evaluated.

Page 3.6-11

- In the environmental justice summary; country of origin and immigration status should also be considered.

Economic and Fiscal Impacts

Page 3.5-1

- Clarification is required if the entire dataset in Section 3.5 "Economics" was calculated using King County level datasets or specific South King County Data Sets. South King County is defined as: Renton, Tukwila, SeaTac, Burien, Des Moines, Normandy Park, Kent, Auburn, and Federal Way.
- Using King County macro level data is not representative of the economic landscape of South King County as it relates to wages, demographics, type & size of industry, etc.

Land Use Impacts

There appear to be unaccounted for impacts from the preferred and S 344th St Alternatives related to affected parking, impacted businesses, and number of employees displaced. These need to be addressed.

The use of the OMF site is inconsistent with the City's urbanizing vision. Address the lack of planning for a smaller footprint for the facility or planning for mixed use by either placing parking in structures thereby allowing for other use of a portion of the property or the use by others of air rights above any of the planned facilities. The possibility of such a project could offset the economic impact of prohibiting the development of 60 acres of strategically located commercial land to its highest and best use.

Specific comments include:

Page ES-11 Figure ES-4

- Apparent unaccounted for impact from the Preferred Alternative to the parking/loading in the northeast corner of the Spectrum Business Park. The EIS should determine if the required parking for the uses at the Spectrum Business Park will be impacted, reduced, or result in any non-conformance.

Page ES-19

- How was this calculated? What are the exact businesses that are being displaced? Is there a spreadsheet of this information? According to Washington State Department of

Revenue there are significantly more 6 active business licenses that will be impacted. This misrepresentation also applies to the South 344th Street Alternative.

- Provide methodology for how the number of employees impacted was calculated. These numbers do not accurately reflect the true number of active businesses that may be impacted and the actual number of impacted employees are likely underrepresented.

The following comments are related to Appendix C

Page 23

- Activation Zone parking spaces are not shown on this map, but shown in others. Plans should be consistent.
- This is the only time in the entire DEIS that the Activation Zone is mentioned, but does not include square footage, uses, benefits, impacts, etc. Additional information for the activation zone is required.
- Any impacts to existing uses shall be addressed including parking stall or loading zone displacement. The OMFS site shall not create any nonconformities.
- Maps should be consistent and the impacts to adjacent uses must be measured. It appears Spectrum Business Park parking is being displaced here. Provide more information on how these impacts will be mitigated and the creation of any nonconformities will be avoided.

Page 27

- The activation zone should serve multi-modal travelers, including those arriving via vehicle. There must be parking available for the activation zone.

The Following comments are related to Appendix H2

Page H2-2

- The reference information for the Federal Way Revised Code and Federal Way Comprehensive Plan are inaccurate and should be updated to reflect the current standards.

Page H2-3

- The preferred and South 344th St alternatives reference some smaller areas within the City Center Core land use designation. This is inaccurate and needs to be updated.

Page H2-4

- The section concerning the Tacoma Dome Link Extension is outdated and needs revision. Not mentioned here is the South Station Subarea Plan and the Countywide Growth Center Candidate Designation which should be included.

Page H2-5 – Table H2-1

- Please provide basis for calculation of 17 acres in the CC-C zone due to OMF impacts.

- For the section concerning City of Federal Way Zone (RM-2400 and RM-3600: Multi-Family), it is not accurate to consider only a portion of the site as zoned multi-family. The preferred alternative is a majority zoned multi-family residential. Additionally, it is not appropriate to consider the OMF use as a Government Facility. Light rail or commuter rail transit facility require a Process IV review in the CC-C & CE zones.

Page H2-6 – Table H2-1

- For the BC: Community Business and CE: Commercial Enterprise zones, the permitting use for the OMFS would be Public Transportation Facilities, per FWRC 19.240.135. Considering the OMF a “Government facility” is not accurate.

Page H2-12 – Table H2-5

- Under Policy LUP 9, the statement that the OMFS site supports light rail operation which would support mixed use development is misleading and inaccurate. The light rail stations support light rail operations. Having the OMF site in the City of Federal Way does not support mixed-use development any more than the OMF site being located at Midway Landfill does.

Page H2-13 – Table H2-5

- Under Topic 2.7 Land Use Designations (Single Family). For Policy LUP14, the mitigation steps should not only be used to support aesthetic compatibility between uses, and should extend to include additional impacts like noise/sound, light, vibration, etc.

- Under Topic 2.7 Land Use Designations (Multi-Family). It is inaccurate to state that this project helps broaden transit options for multi-family households in the Federal Way area. The light rail stations support light rail operations. Having the OMF site in the City of Federal Way does not help broaden transit options for MF in the Federal Way area.

Page H2-15 – Table H2-5

- The response provided for consistency with comprehensive Plan Policy LU40 is inappropriate. The policy is about the range of retail and supportive uses.

Visual and Aesthetic Resources

Page 3.7-7

- The i5 and Pac Hwy corridor in Federal Way consists of significant asphalt surfacing, removing trees within this area will have an increasingly negative impact on the City's urban heat index and citywide tree canopy coverage. Impacts to the urban heat index and the citywide tree canopy coverage should be evaluated between alternatives. Tree planting to meet the average Citywide canopy (35%) should be a target for this facility, if located in Federal Way.

Page 3.7-11 – Figure 3.7-6

- The image shows redirected power lines. Confirm if this was intentional? Will they be redirected?

Page 3.7-16 – Figure 3.7-12

- The photo for the existing condition and simulation of proposed conditions appear to be the same. Confirm that no visual change is expected.

Page 3.7-17 – Figure 3.7-14

- A cell tower appears to be removed in the simulation of proposed conditions. Confirm this removal and provide mitigation method for tower if removal is expected.

Noise and Vibration

Page 3.9-7

- Confirm the methodology and noise sources used in the noise analysis. Were the maintenance activity and testing of horns noise generators included in the projections?
- The evaluation of noise impacts shall measure and account for any increase in ambient Interstate 5 noise resulting from tree removal and sound barrier as part of the track construction for both the preferred and S 344th alternatives.

Ecosystems and Resources

Page 3.10-26

- Language indicates that 'frontage improvements along S 336th Street to meet city standards may necessitate the installation of a replacement structure where West Fork Hylebos Tributary is crossed by the road.' This should be changed to 'must replace the culvert.'

Page 3.11-12

- Any impacts to wetlands related to the extension of 18th Place S shall be eliminated or demonstrated to the City that impacts have been minimized and mitigated.

- Language indicates that 'frontage improvements along S 336th Street to meet city standards may necessitate the installation of a replacement structure where West Fork Hylebos Tributary is crossed by the road.' This should be changed to 'must replace the culvert.'

Page 3.11-19

- Any impacts to wetlands related to the extension of 18th Place S shall be eliminated or demonstrated to the City that impacts have been minimized and mitigated.

Cumulative Effects

Page 4-3

- There is a large tree canopy with mature trees that will be heavily impacted by the proposed 18th Place S extension as part of the preferred alternative. Currently as proposed neither OMFS sites in Federal Way will meet Tree retention requirements. Please address.

Page 4-8

- Within section 4.1 under transportation, the City Center Access Project for Federal Way is described as unfunded. This is incorrect, the construction phase is currently unfunded however the design and right of way is funded. Please adjust.

Please reach out to either of us or Kent Smith if you have any questions regarding the comments in this letter.

Sincerely,

EJ Walsh, P.E.

Why does the OMF site need to accommodate all of these LRVs when another OMF site is being planned for in the north. How is the OMF capacity being balanced across sites. A reduction in the minimum LRV capacity at OMFS should be able to reduce the land take, preserve more trees, reduce stream and wetland impact, and reduce impacts to neighboring residential uses.

Overall Comments:

- The analysis provided does not adequately analyze the preferred and 344th Street alternatives as not all new driveways/intersections are included and/or incorrect driveways are included. Additionally, v/c must be recorded for all intersections including those along State Routes as the City of Federal Way controls these intersections.

- There is insufficient information provided related to the existing land uses removed and traffic rerouted as a result of vacated streets. Supplemental trip generation analysis and volume figures should be provided to illustrate how these conditions impact the future volumes. Without this information it is not possible to validate the future volumes provided.

- Additional attachments must be provided including detailed trip generation information for the OMF South site and existing land uses; traffic counts; and Synchro worksheets.

The extension of 18th Place S is described as intersection S 336th Street as the fourth (NB) leg of the 18th Ave S/S 336th St intersection, but the conceptual site plan does not depict it in this way due to the creek. It is assumed that a four-leg intersection is not feasible here and therefore the description/analysis should be revised accordingly.

While it is acceptable to use collision data from 2016 to 2018 because collision data during the pandemic was atypical, many studies have found that collision rates were higher during the pandemic. Therefore it may not be accurate to say that 2016 to 2018 collision data is more conservative.

This figure shows intersection 10 as a new intersection, but intersection 10 no longer exists as part of the preferred alternative site plan based on Figure G1.1-2 and the roadway network description. If this driveway no longer exists, the volumes going through this intersection would need to be routed to other site access points and other study area intersections.

Additionally, this figure does not show intersection 11 (18th Place S Extension/S 336th Street), but intersection is included in the LOS tables. Finally, the intersections of 21st Avenue S/S 341st Place and 21st Avenue S Extension/S 344th Street should be included in the analysis as well as future volume figures.

Overall, the analysis provided does not sufficiently analyze the operational impacts of the preferred alternative.

This figure shows intersection 10 as a new intersection, but intersection 10 no longer exists as part of the preferred alternative site plan based on Figure G1.1-2 and the roadway network description. If this driveway no longer exists, the volumes going through this intersection would need to be routed to other site access points and other study area intersections.

Additionally, this figure does not show intersection 11 (18th Place S Extension/S 336th Street), but intersection is included in the LOS tables. Finally, the intersections of 21st Avenue S/S 341st Place and 21st Avenue S Extension/S 344th Street should be included in the analysis as well as future volume figures.

It is also not clear how the rerouted vehicles from roadway closures are accounted for. For example, the no-build conditions show 85 vehicles exiting 20th Avenue S during the PM peak hour. However, there are only 15 additional right turns at intersection 1 and no additional left turns beyond project trips. While volumes for intersection 11 are not shown, based on the future volumes at intersection 1, it does not appear that additional trips are routed to intersection 11. If these trips would no longer exist due to land uses being removed, it is not clear from this analysis as no trip generation fore existing land uses to be removed is provided. A figure showing how existing traffic was removed and rerouted should be included.

Overall, the analysis provided does not sufficiently analyze the operational impacts of the preferred alternative.

If Intersection 1 is only providing access to the Christian Faith Church under build conditions, and little to no project trips are projected it is unlikely that this intersection would observe as much traffic as it does today. This analysis does not sufficiently account for (or sufficiently document) traffic that would be rerouted from 20th Avenue S due to the closure. As such, this analysis may not adequately take into account additional impacts along SR 99 or 16th Street as a result.

More broadly, a figure showing how existing traffic was removed and rerouted should be included.

Response provided for Policy LU40 is inappropriate. The policy is about the range of retail and supportive uses.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
1	**Alternatives Considered** Page 2-16 • How can environmental impacts from TDLE be considered part of the "no-build" alternative if TDLE does not have an approved environmental document?	As stated in the Draft EIS, the No-Build Alternative represents the transportation system and environment as they would exist without the proposed project and provides a benchmark against which the build alternatives can be compared. It assumes the other Link light rail system improvements listed in Sound Transit 3 would be built, including extensions to West Seattle, Ballard, Everett, downtown Redmond, Issaquah, and Tacoma. The No-Build Alternative also assumes that the new North Corridor OMF would be constructed. Under the target schedule for Sound Transit's System Expansion Plan, each of these projects would be operating by 2042.
2	Page 3.2-8 • 20th Avenue S is listed incorrectly as 20th Avenue E. Please address.	The error has been corrected in the Final EIS.
3	Page 3.2-12 • Historical collision date was collected between January 2016 to December 2018. This should be updated with more current data.	The Final EIS relies on data from 2016 to 2018 as it provides a more conservative (higher) collision rate than data from 2020 and 2021, which reflect lower traffic volumes during the years of the COVID pandemic. As the project alternatives are not expected to result in impacts to traffic safety, the collision data do not have a bearing on decisions related to the alternatives.
4	• Intersections with a collision rate above 1.0 per MEV will need to be discussed in greater detail as to potential contributing factors.	As stated in Section 3.7 of Appendix G1, Transportation Technical Report, of the Final EIS no notable contributing factors were provided for the fatal and serious injury crashes for either of the study areas other than two due to driver inattention and one due to driver disregard for a traffic signal.
5	• Additionally, the societal cost per MEV must be provided in the collision summary tables and discussed.	Each OMF South alternative is analyzed with the same type of data and methodology to allow for an equal comparison among alternatives. Therefore, the societal cost of collisions per million entering vehicles (MEV) was not included in the analysis. The analysis assesses accidents currently occurring within the project limits for each alternative in terms of type, cause, and frequency in order to equally compare alternatives across jurisdictions, as described in the transportation section of the 2019 Environmental Technical Analysis Methods Report (Attachment G1-1 to Appendix G1, Transportation Technical Report, of the Final EIS) reviewed by the city of Federal Way in its capacity as a member of the Interagency Group.
6	Page 3.2-13 • It is noted that the annual growth rate is based on the growth rate used for TDLE traffic studies, but please specify what the basis for the assumed TDLE annual growth rate was. Typically, a higher annual growth rate closer to 1.25 percent has been used in the City of Federal Way.	The annual growth rate used for the OMF South analysis (0.8 percent) was based on the Puget Sound Regional Council travel demand model used for TDLE. Although TDLE ended up using a 0.5 percent annual growth rate for their analysis, OMF South continued to use a 0.8 percent annual growth rate to take a more conservative approach. The growth rate represents an average rate over the next 20 years, accounting for higher than average growth in some years and lower than average growth in others.

7	• Was this signal timing optimization vetted with WSDOT and/or City of Federal Way? Are there other external factors outside of the study area that would impact the ability to optimize the signal timings?	Optimizing signal timing is a standard practice based on the assumption that agencies will update their signal timing at some point in the next 20 years. The study team met with the City of Federal Way on July 28, 2022, during which city staff confirmed this approach.
8	Page 3.2-14 • Routes 177 and 577 would still be faster than light rail for several years, so there will be opposition to discontinuing those routes.	Comment acknowledged. Sound Transit and King County Metro would evaluate the need to continue or reduce bus service along I-5 between Seattle and Federal Way as the Link system expands and service needs change.
9	Page 3.2-16 • A more comprehensive trip generation section needs to be provided in this report. The appendices do not include detailed calculations and the methodology outlined here does not match with the methodology outlined in the appendices (i.e. trip generation does not appear to account for delivery-related trips or other non-employee trips).	Estimates for the number of employees arriving and departing the site were determined by Sound Transit based on forecast staffing levels. The amount of freight traffic to and from the OMF site is anticipated to be minimal, particularly during the AM and PM peak hours, as deliveries would occur during off-peak hours. Therefore, freight traffic was not included in trip generation estimates from OMF South operations. Section 3.2, Transportation, in the Final EIS and Section 4.2.1.1 of Appendix G1, Transportation Technical Report, were updated to clarify this.
10	• Given that this is a long-range analysis, and that the evaluated alternatives result in major changes to the roadway network, it is not appropriate to base trip distribution assumptions on existing travel patterns alone. Trip distribution patterns should be based on the regional travel model and adjusted as needed based on changes to the roadway network.	Travel demand modeling was not performed for this study. Many properties between S 336th Street and S 344th Street would be acquired as part of the OMF South project and the remaining trips that currently use 20th Avenue S were relocated. Given there are no other developments in the study area, it is reasonable to assume existing travel patterns to and from the study area would remain in the future.
11	Page 3.2-17 • It cannot be definitely stated that no new safety issues would be introduced and no existing safety issues would be exacerbated. Particularly given the elimination of north-south connectivity for non-motorized traffic in the South 344th Street Alternative.	Final EIS Section 3.2, Transportation, explains the reasons why the project is not expected to introduce new safety issues or exacerbate existing safety issues. If the South 344th Street Alternative were selected as the project to be built, Sound Transit would evaluate options for replacing the function of the greenway between S 336th Street and S 344th Street. Section 3.2.2.2, Long-Term Impacts (to Transportation), of the Final EIS has been updated to reflect this along with Section 4.2.3.6 of Appendix G1, Transportation Technical Report.
12	• The City of Federal Way's street vacation process should be referenced as it relates to the currently proposed roadway network and potential ongoing coordination.	The Final EIS discusses Federal Way's street vacation process and requirements in Section 3.4, Land Use.
13	Page 3.2-18 • The description of the new 18th Avenue S intersection is not consistent with the provided site plan. The description and if applicable, the associated analysis, should be updated.	The intersection of 18th Place S would form an additional three-legged intersection with S 336th Street east of the three-legged intersection formed by 18th Avenue S and S 336th Street. It would not change the associated traffic analysis. This has been corrected in the Final EIS.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
14	• Parking study needs to be updated from the FWLE EIS to be consistent with ability to remove stalls without replacement. Does this include stalls removed for S324th culvert and roadway grade construction?	The parking analysis does not include stalls removed for grading and culvert installation at S 324th Street, which is part of Federal Way's City Center Access project. The removal of parking spaces associated with OMF South, including from the South 320th Street Park & Ride, would not affect the accommodation of parking demand by FWLE. The Federal Way Link Extension EIS identified that parking demand from FWLE would be accommodated through the parking provided at the Kent Des-Moines, Star Lake, and Federal Way Downtown stations, with excess parking available at the S 272nd Star Lake Station.
15	Page 3.2-19 – Table 3.2-6 • v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.	SR 99 is a highway of statewide significance, so the intersections along SR 99 are measured against WSDOT standards for level of service (LOS). This is discussed in Section 3.2.1.2, Arterial and Street Operations, of the Final EIS. Using LOS standards for SR 99 intersections also allows an equal comparison of the impacts between OMF South alternatives in Kent and Federal Way.
16	• Intersection 10 (SR 99/Driveway) is no longer proposed as part of the preferred alternative.	This has been corrected in the Final EIS.
17	• Additional new intersections and site access points are not included in the analysis and are not summarized in Table 3.2-6. All new site driveways and new intersections resulting from roadway extensions must be provided in this table.	Gate operations are discussed in Final EIS Section 3.2.2.2, Long-Term Impacts. All new trips to/from south of the OMF South Preferred Alternative site are expected to travel through the western driveway with the guard shack and through intersections #5, #6, and #8. No trips are expected to travel through intersection #9, and no new trips are expected to travel along S 341st Street east of the guard shack, so no new trips are expected to travel through either the 21st Avenue S/S 341st Place or 21st Avenue S Extension/S 344th Street intersection.
18	Page 3.2-20 – Table 3.2-7 • v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.	Please see response to Comment ID 15.
19	• 55 seconds of delay would typically indicate LOS E conditions. Without Synchro worksheets provided, it cannot be definitely confirmed that there are no impacts at this intersection. Please clarify.	LOS E is defined as a delay of 60 to 80 seconds, as shown in Table 3.2-2 in Final EIS Section 3.2, Transportation. The traffic analysis has been updated for the Final EIS, and intersection #2 now has a delay of 49 seconds during the Preferred Alternative 2042 PM Peak Hour Traffic Operations (Table 3.2-7). The Synchro reports will be included with the Traffic Impact Report that will be submitted as part of the design review process during the final design phase of the project.
20	• Intersection 10 (SR 99/Driveway) is no longer proposed as part of the preferred alternative.	Please see response to Comment ID 16.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
21	- Additional new intersections and site access points are not included in the analysis and are not summarized in Table 3.2-7. All new site driveways and new intersections resulting from roadway extensions must be provided in this table.	Please see response to Comment ID 17.
22	Page 3.2-21 and page 3.2-25 - Figure 3.2-7 and Figure 3.2-8 - This figure should indicate the new roadway extensions that are part of the preferred alternative. Additionally, new intersections and site driveways must be included in the analysis and shown on the figure.	These figures have been updated in the Final EIS to show the new intersections and roadway extensions. Intersection #11 (18th Place S Extension/S 336th Street) has been included in the analysis in the Final EIS.
23	Page 3.2-22 - The City of Federal Way's street vacation process should be referenced as it relates to the currently proposed roadway network and potential ongoing coordination.	Please see response to Comment ID 12.
24	Page 3.2-23 and page 3.2-24 - Table 3.2-8 and Table 3.2-9 - v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.	Please see response to Comment ID 15.
25	- If volume projections are included for intersection 10 (as shown on the previous figures), then the traffic operations results should be shown in this table.	Final EIS Appendix G1, Transportation Technical Report, and Section 3.2, Transportation, have been revised to remove intersection #10 from the South 344th Street Alternative analysis as it represents an intersection internal to the site. Tables 3.2-8 and 3.2-9 have been corrected.
26	Page 3.2-26 - This would have a significant impact as a north-south bicycle connection would not be possible and the majority of injury-related crashes involved ped and cyclists along SR 99.	The design for the South 344th Street Alternative has not been advanced beyond the conceptual design used for the 2021 SEPA Draft EIS, as stated in Section 2.2.8 of the Final EIS. If the South 344th Street Alternative were selected as the project to be built, Sound Transit would evaluate options for replacing the function of the greenway between S 336th Street and S 344th Street. Data provided in Section 3.7 of Appendix G1, Transportation Technical Report, in the Final EIS show that most injury-related collisions between 2016 and 2018 involved motor vehicles, not pedestrians and bicyclists.
27	Page 3.2-32 – Table 3.2-13 - S 330th St is inappropriate for a haul route, as it is narrow, has a small traffic circle at 20th Ave S, and traverse’s residential areas with some areas of high parking utilization.	Comment acknowledged. Haul routes would be determined by the contractor during final design and coordinated with the City of Federal Way.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
28	Page 3.2-13 - In addition to the impacts of truck activity, the impacts of trips related to workers traveling to and from the site should be quantified and discussed.	The estimates for construction truck traffic were made to differentiate impacts between the three build alternatives and, particularly, between the three subsurface construction design options for the Midway Landfill Alternative. The number of construction workers traveling to and from the site cannot be estimated at this time because it would depend on several factors, primarily the construction means, methods, and schedule, which have not yet been determined.
29	- Please clarify how many workers would be traveling to and from the site and if there would be sufficient parking on-site for all workers to park.	The number of construction workers traveling to and from the site cannot be estimated at this time because it would depend on several factors, primarily the construction means, methods, and schedule, which have not yet been determined. However, Sound Transit would require the contractor to develop a construction transportation management plan to address construction employee parking in accordance with Federal Way requirements, as stated in Section 3.2.2.4, Avoidance and Minimization of Impacts, of the Final EIS.
30	Page 3.2-35 - S 330th St is not an acceptable haul route.	Please see response to Comment ID 27.
31	Page 3.2-42 - Consistent with the executive summary, the City's street vacation process should be referenced as an ongoing coordination effort related to the reconfiguration of the street network for both Federal Way alternatives.	Please see response to Comment ID 12.
32	**The following comments are related to Appendix C** Page 1 Additional support information is needed related to access for the proposed driveways for the midway landfill alternative. Support information for the proposed driveway widths and geometry is needed. Channelization and median improvements are needed on Pacific Hwy to support the new accesses.	Appendix C, Conceptual Design Drawings and Engineering Information, was intended to provide illustrative examples of the conceptual site designs for each OMF South alternative. The drawings are not to the level of detail required for formal submittals for permit approval and were not presented as such. Sound Transit has submitted design plans for the Preferred Alternative to Federal Way for review and will continue to address comments through ongoing design coordination should the Board select the Preferred Alternative or South 344th Street Alternative as the project to be built.
33	Page 11 - The location of the track over/across the parking lot may impact the existing parking lot illumination. Evaluation and potential mitigation are needed as necessary.	Please see response to Comment ID 32.
34	Page 12 - The location of the track over/across the parking lot may impact the existing parking lot illumination. Evaluation and potential mitigation are needed as necessary.	Please see response to Comment ID 32.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
35	- Location of track over/across S 322nd St may impact driver visibility of existing traffic signal at S 322nd St/23rd Ave S intersection. Evaluate and mitigate, if needed.	Please see response to Comment ID 32.
36	- Location of track over/across 23rd Ave S may impact driver visibility of traffic signal at S 322nd St/23rd Ave S intersection. Evaluate and mitigate, if needed.	Please see response to Comment ID 32.
37	Page 15 - Set gate further from 24th Ave S so that access ST maintenance vehicles can pull completely out of the roadway when opening the gate.	Please see response to Comment ID 32.
38	- Clarity is needed for a section of asphalt shown on the plans along 24th Avenue S near S 333rd St.	Please see response to Comment ID 32.
39	Page 16 - A proposed column is shown within the intersection of Winged Foot Way and Burning Tree Blvd. A revised location shall be provided	Please see response to Comment ID 32.
40	Page 17 and Page 19 - Adjustment to the location of the proposed sidewalk, curb, and landscape strip for 24th Ave S is required.	Please see response to Comment ID 32.
41	Page 22 - Adjustment is needed for the access to the WSDOT stormwater facility at 21st Ave S and S 344th St. Update design to represent the intended roadway curve. Revise the access to driveway standards.	Please see response to Comment ID 32.
42	Page 25 - A 10-foot clear zone is required from roadway edge to face of proposed retaining walls.	Please see response to Comment ID 32.
43	Page 27 - On-street parking is shown along the proposed 18th Place S. On-street parking is allowed provided that it is outside the prescriptive sight triangle of the intersection and does not result in impacts to adjacent critical areas.	Please see response to Comment ID 32.
44	- S 341st Place is incorrectly shown as S 340th St. Please correct.	Please see response to Comment ID 32.
45	Page 34 - The location of the track over/across the parking lot may impact the existing parking lot illumination. Evaluation and potential mitigation are needed as necessary.	Please see response to Comment ID 32.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
46	Page 37 - More evaluation is needed for access needs for existing properties adjacent to the proposed S 344th St Site alternative.	Please see response to Comment ID 32.
47	- Additional sidewalk connectivity is needed for a portion of the removed S 341st Place.	Please see response to Comment ID 32.
48	**The following comments are related to Appendix G1** Overall Comments: The analysis provided does not adequately analyze the preferred and 344th Street alternatives as not all new driveways/intersections are included and/or incorrect driveways are included. Additionally, v/c must be recorded for all intersections including those along State Routes as the City of Federal Way controls these intersections. There is insufficient information provided related to the existing land uses removed and traffic rerouted as a result of vacated streets. Supplemental trip generation analysis and volume figures should be provided to illustrate how these conditions impact the future volumes. Without this information it is not possible to validate the future volumes provided. Additional attachments must be provided including detailed trip generation information for the OMF South site and existing land uses; traffic counts; and Synchro worksheets. An updated parking analysis for the WSDOT 320th/23rd Ave park and ride needs to be completed to support removal of parking spaces consistent with the FWLE EIS that assumed use of this park and ride for LINK/Regional Transit riders.	These comments are addressed more specifically through responses to comments 49 through 97 below.
49	Page G1-i - The summary states that impacts may occur if the delay in an LOS F condition is worsened by more than 10 seconds. Please clarify the basis for this standard as it is not specified in Attachment A. Additionally, the City of Federal Way standards should be referenced here since they are based on v/c rather than LOS/delay.	As described in Section 3.2.3.1 in Final EIS Appendix G1, Transportation Technical Report, Sound Transit typically uses a 10-second or 10 percent additional delay threshold when determining whether mitigation is needed for intersections already operating at LOS F. This threshold is used because it represents the conditions when there would start to be a noticeable vehicle delay increase compared with the No-Build Alternative. The summary text has been corrected in the Final EIS to include Federal Way v/c standards.
50	Page G1-3 – Figure G1.1-2 - The extension of 18th Place S is described as intersection S 336th Street as the fourth (NB) leg of the 18th Ave S/S 336th St intersection, but the conceptual site plan does not depict it in this way due to the creek. It is assumed that a four-leg intersection is not feasible here and therefore the description/analysis should be revised accordingly.	The text has been revised in Section 4.2, Long-Term Impacts, in Final EIS Appendix G1, Transportation Technical Report, to reflect that the extension of 18th Place S would create a new three-legged intersection on the south side of S 336th Street.

City of Federal Way (Communication ID 539072)

Comment ID	Comment Text	Response
51	Page G1-20 • In section 3.2.3 Traffic Volumes, please clarify what "as applicable" means for the adjusted 2022 traffic volumes. For instance, was volume balancing between intersections a key factor?	Additional volume was added to select movements at intersections #2, #4, and #7 to account for the additional volume in 2022. This additional volume was distributed throughout the roadway system as applicable, meaning that this additional volume would not impact every intersection or movement. Volumes between intersections where there are no driveways was also balanced. Section 3.2.2 in Final EIS Appendix G1, Transportation Technical Report was updated to clarify this.
52	Page G1-21 – Figure G1.3-7 • During the AM peak hour, existing volumes at intersections 6 and 9 have decreased as compared to the 2021 DEIS resulting in greater volume imbalances between intersections in some cases. Please explain the change from the 2021 DEIS to the 2023 ADEIS	The AM peak hour volumes for intersections #6 and #9 used in the 2021 Draft EIS were incorrectly input. The updated volumes used for the transportation analysis in Appendix G.1, Transportation Technical Report, and Section 3.2, Transportation, in the Final EIS more accurately reflects the intersection counts collected in September 2019.
53	Page G1-29, G1-31, G1-58, and G1-60 – Table G1.3-9, Table G1.3-11, Table G1.4-1, and Table G1.4-3 • v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.	Please see response to Comment ID 15.
54	Page G1-44 • Under section 3.7 Safety, while it is acceptable to use collision data from 2016 to 2018 because collision data during the pandemic was atypical, many studies have found that collision rates were higher during the pandemic. Therefore, it may not be accurate to say that 2016 to 2018 collision data is more conservative	The 2016 to 2018 data are more conservative than the collision data from 2020 and 2021 because the 2016 to 2018 data showed higher collision frequencies.
55	Page G1-55 • Intersections with a collision rate above 1.0 per MEV will need to be discussed in greater detail as to potential contributing factors. Additionally, the societal cost per MEV must be provided in the collision summary tables and discussed.	Please see responses to Comment IDs 4 and 5.
56	Page G1-54 • Under section 4.1.1.2 Traffic Volumes, it is noted that the annual growth rate is based on the growth rate used for TDLE traffic studies, but please specify what the basis for the assumed TDLE annual growth rate was. Typically, a higher annual growth rate closer to 1.25 percent has been used in the City of Federal Way.	Please see response to Comment ID 6.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
57	Page G1-55 • In the 2042 PM analysis there is a mention of a decrease in delay due to signal optimization. Was this signal timing optimization vetted with WSDOT and/or City of Federal Way? Are there other external factors outside of the study area that would impact the ability to optimize the signal timings? Additionally, you cannot look at one SR-99 intersection in a vacuum as the entire corridor is coordinated.	Please see response to Comment ID 7.
58	Page G1-68 • Given that this is a long-range analysis, and that the evaluated alternatives result in major changes to the roadway network, it is not appropriate to base trip distribution assumptions on existing travel patterns along. Trip distribution patterns should be based on the regional travel model and adjusted as needed based on changes to the roadway network.	Please see response to Comment ID 10.
59	Page G1-69 • A more comprehensive trip generation sections needs to be provided in this report. The appendices do not include detailed calculations and the methodology outlined here does not match with the methodology outlined in the appendices (i.e. trip generation does not appear to account for delivery-related trips or other non-employee trips).	Please see response to Comment ID 9.
60	Page G1-70 • Under section 4.2.1.5 Parking, please specify the approximate number of parking spaces this represents for each alternative.	These streets do not have delineated parking spaces, so it is difficult to estimate the number of spaces lost. Final EIS Appendix G1, Transportation Technical Report, gives estimates in the Parking subsection under the discussion of Long-Term Impacts for each build alternative, when possible. In most cases, developments that may currently use the on-street parking that would be removed would be acquired as part of the project.
61	Page G1-71 • Under section 4.2.1.6 Safety, this section should address the intersections with a collision rate over 1.0 collisions per MEV and discuss how the project may impact these locations. Additionally, if north-south non-motorized facilities would not be feasible as part of the 344th Street Alternative, safety would not improve for non-motorized users and could in fact worsen. Please elaborate	As described in Section 4.2 of Final EIS Appendix G1, Transportation Technical Report, the OMF South alternatives are not expected to result in any safety impacts to roadway intersections in the study area, including those with a crash rate greater than 1.0 collision per MEV. As described in Appendix G1 Section 4.2.3.6, Nonmotorized Facilities, the South 344th Street Alternative would result in the removal of the greenway between S 336th Street and S 344th Street, which would eliminate an existing north-south nonmotorized connection. If the South 344th Street Alternative were selected as the project to be built, Sound Transit would evaluate options for replacing the function of the greenway between S 336th Street and S 344th Street.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
62	Page G1-72 - The City of Federal Way's street vacation process should be referenced for both City of Federal Way alternatives as it relates to the currently proposed roadway network and potential ongoing coordination.	Please see response to Comment ID 12.
63	- In section 4.2.2.1 regarding the extension of 18th Place S there is a section indicating that it would convert the existing S 336th St/18th Avenue S intersection into a four-legged intersection. This is not consistent with the provided site plan. The description and if applicable, the associated analysis should be updated.	Please see response to Comment ID 50.
64	- Information regarding existing land uses to be removed and associated trip generation projections for those uses need to be provided in section 4.2.2.2 Traffic Volumes	Section 4.2.2.2, Traffic Volumes, has been updated in Final EIS Appendix G1, Transportation Technical Report, to provide more information about trip generation projections for the Preferred Alternative and includes two new figures, Figures G1.4-7 and G1.4-8, that show existing trips to be removed and projected rerouted trips from roadway closures, respectively. Appendix G1 Section 4.2.3.2, Traffic Volumes has been similarly updated for the South 344th Street Alternative.
65	Page G1-73 – Figure G1.4-7 - In addition to trip assignment, trip distribution figures should be included. Alternatively, trip distribution percentages could be illustrated on this figure (Figure G1.4-7).	Figures G1.4-7 and G1.4-8 in Final EIS Appendix G1, Transportation Technical Report, have been added that show existing trips to be removed and projected rerouted trips from roadway closures, respectively. (Figures G1.4-7 and G1.4-8 have been renumbered as Figures G1.4-9 and G1.4-10, respectively.)
66	- This figure should indicate new roadway extensions that are part of the preferred alternative.	This figure, now labeled Figure G1.4-9, has been updated in Final EIS Appendix G1, Transportation Technical Report to show the new intersections and roadway extensions.
67	- This figure shows intersection 10 as a new intersection, but intersection 10 no longer exists as part of the preferred alternative site plan based on Figure G1.1-2 and the roadway network description. If this driveway no longer exists, the volumes going through this intersection would need to be routed to other site access points and other study area intersections.	This figure, now labeled Figure G1.4-9, has been corrected in the Final EIS.
68	Additionally, this figure does not show intersection 11 (18th Place S Extension/S 336th Street), but intersection is included in the LOS tables.	Intersection #11 has been added to this figure in Final EIS Appendix G1, Transportation Technical Report, now Figure G1.4-9.

City of Federal Way (Communication ID 539072)		
Comment ID	Comment Text	Response
	Finally, the intersections of 21st Avenue S/S 341st Place and 21st Avenue S Extension/S 344th Street should be included in the analysis as well as future volume figures. Overall, the analysis provided does not sufficiently analyze the operational impacts of the preferred alternative.	All new trips to/from south of the OMF South Preferred Alternative site are expected to travel through the western driveway with the guard shack and through intersections #5, #6, and #8. No trips are expected to travel through intersection #9, and no new trips are expected to travel along S 341st Street east of the guard shack, so no new trips are expected to travel through either the 21st Avenue S/S 341st Place or 21st Avenue S Extension/S 344th Street intersection.
69	Page G1-74 – Figure G1.4-8 • This figure should indicate new roadway extensions that are part of the preferred alternative.	This figure, now labeled Figure G1.4-10, has been updated in Final EIS Appendix G1, Transportation Technical Report to show the new intersections and roadway extensions.
70	• This figure shows intersection 10 as a new intersection, but intersection 10 no longer exists as part of the preferred alternative site plan based on Figure G1.1-2 and the roadway network description. If this driveway no longer exists, the volumes going through this intersection would need to be routed to other site access points and other study area intersections.	This figure, now labeled Figure G1.4-10, has been corrected in Final EIS Appendix G1, Transportation Technical Report
71	Additionally, this figure does not show intersection 11 (18th Place S Extension/S 336th Street), but intersection is included in the LOS tables.	Intersection #11 has been added to this figure, now labeled Figure G1.4-10 in Final EIS Appendix G1, Transportation Technical Report.
72	Finally, the intersections of 21st Avenue S/S 341st Place and 21st Avenue S Extension/S 344th Street should be included in the analysis as well as future volume figures.	Please see response to Comment ID 68.
73	It is also not clear how the rerouted vehicles from roadway closures are accounted for. For example, the no-build conditions show 85 vehicles exiting 20th Avenue S during the PM peak hour. However, there are only 15 additional right turns at intersection 1 and no additional left turns beyond project trips. While volumes for intersection 11 are not shown, based on the future volumes at intersection 1, it does not appear that additional trips are routed to intersection 11. If these trips would no longer exist due to land uses being removed, it is not clear from this analysis as no trip generation fore existing land uses to be removed is provided. A figure showing how existing traffic was removed and rerouted should be included. Overall, the analysis provided does not sufficiently analyze the operational impacts of the preferred alternative.	Please see response to Comment ID 64.
74	Page G1-75 – Table G1.4-10 • Intersection 10 (SR 99/Driveway) is longer proposed as part of the preferred alternative.	Table G1.4-10 has been corrected in Final EIS Appendix G1, Transportation Technical Report.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
75	- v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.	Please see response to Comment ID 15.
76	- Additional new intersections and site access points are not included in the analysis and are not summarized in Table G1.4-10. All new site driveways and new intersections resulting from roadway extensions must be provided in this table.	Gate operations are discussed in Section 4.2, Long-Term Impacts, in Final EIS Appendix G1, Transportation Technical Report. All new trips to/from south of the OMF South Preferred Alternative site are expected to travel through the western driveway with the guard shack and through intersections #5, #6, and #8. No trips are expected to travel through intersection #9, and no new trips are expected to travel along S 341st Street east of the guard shack, so no new trips are expected to travel through either the 21st Avenue S/S 341st Place or 21st Avenue S Extension/S 344th Street intersection.
77	Page G1-76 and G1-78 – Figure G1.4-9 and Figure G1.4-10 - This figure should indicate the new roadway extensions that are part of the preferred alternative. Additionally, new intersections and site driveways must be shown on the figure.	These figures, now labeled Figures G1.4-11 and G1.4-12, have been updated in Final EIS Appendix G1, Transportation Technical Report, to show the new site driveways, intersections, and roadway extensions.
78	Page G1-77 – Table G1.4-11 - 55 seconds of delay would typically indicate LOS E conditions. Without Synchro worksheets provided, it cannot be definitely confirmed that there are no impacts at this intersection. Please clarify.	Please see response to Comment ID 19.
79	- Intersection 10 (SR 99/Driveway) is longer proposed as part of the preferred alternative.	Table G1.4-11 in Final EIS Appendix G1, Transportation Technical Report, has been corrected by removing intersection #10.
80	- v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.	Please see response to Comment ID 15.
81	- Additional new intersections and site access points are not included in the analysis and are not summarized in Table G1.4-10. All new site driveways and new intersections resulting from roadway extensions must be provided in this table.	Please see response to Comment ID 76.
82	Page G1-79 - In section 4.2.2.6 Nonmotorized Facilities, it should be more clearly defined where and what bicycle and pedestrian improvements are proposed as part of the preferred alternative.	Section 4.2.2.6, Nonmotorized Facilities, in Final EIS Appendix G1, Transportation Technical Report, describes the proposed nonmotorized facilities for the Preferred Alternative based on the current preliminary design. If the Preferred Alternative is selected as the project to be built, these facilities will be more clearly defined as design progresses in coordination with Federal Way.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
83	• In section 4.2.2.8 Safety, the safety section should address if the project would impact intersections that already have a crash rate greater than 1.0 collisions per MEV.	Please see response to Comment ID 61.
84	Page G1-80 • In section 4.2.3.2 Traffic Volumes, information regarding existing land uses to be removed and associated trip generation projections for those uses need to be provided in this section.	Please see response to Comment ID 64.
85	Page G1-81 – Figure G1.4-11 • In addition to trip assignment, trip distribution figures should be included. Alternatively, trip distribution percentages could be illustrated on this figure (Figure G1.4-11).	Figures G1.4-13 and G1.4-14 in Final EIS Appendix G1, Transportation Technical Report, have been added that show existing trips to be removed and projected rerouted trips from roadway closures, respectively. (Figures G1.4-11 and G1.4-12 have been renumbered as Figures G1.4-15 and G1.4-16, respectively.)
86	Page G1-82 – Figure G1.4-12 • Intersection 10 is mislabeled for both AM and PM peak hours.	Final EIS Appendix G1, Transportation Technical Report, and Section 3.2, Transportation, have been revised to remove intersection #10 from the South 344th Street analysis because it represents an intersection internal to the site. This figure, now labeled G1.4-16, has been corrected to remove intersection #10 from the analysis.
87	• If Intersection 1 is only providing access to the Christian Faith Church under build conditions, and little to no project trips are projected it is unlikely that this intersection would observe as much traffic as it does today. This analysis does not sufficiently account for (or sufficiently document) traffic that would be rerouted from 20th Avenue S due to the closure. As such, this analysis may not adequately consider additional impacts along SR 99 or 16th Street as a result. More broadly, a figure showing how existing traffic was removed and rerouted should be included.	Section 4.2.3.2 in Final EIS Appendix G1, Transportation Technical Report explains that existing trips from properties that would be acquired were removed and existing trips that would be rerouted due to changes in the roadway network were rerouted to other intersections or intersection movements. The existing trips from properties that would be acquired and the existing trips that would be rerouted due to changes in the roadway network are shown in Appendix G1 Figures G1.4-13 and G1.4-14, respectively.
88	Page G1-83 and G1-85 – Table G1.4-12 and Table G1.4-13 • If volume projections are included for intersection 10 (as shown on the previous figures), then the traffic operations results should be shown in this table.	Tables G1.4-12 and G1.4-13 in Final EIS Appendix G1, Transportation Technical Report, have been corrected to remove intersection #10 from the analysis.
89	• v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.	Please see response to Comment ID 15.

City of Federal Way (Communication ID 539072)		
Comment ID	Comment Text	Response
90	Page G1-84 – Figure G1.4-13 - If volume projections are included for intersection 10 (as shown on the previous figures), then the traffic operations results should be shown on this figure (Figure G1.4-13).	This figure, now labeled G1.4-17 in Final EIS Appendix G1, Transportation Technical Report, has been corrected to remove intersection #10 from the analysis.
91	Page G1-86 – Figure G1.4-14 - If volume projections are included for intersection 10 (as shown on the previous figures), then the traffic operations results should be shown on this figure (Figure G1.414).	This figure, now labeled Figure G1.4-18 in Final EIS Appendix G1, Transportation Technical Report, has been corrected to remove intersection #10 from the analysis.
92	Page G1-87 - In section 4.2.3.6 Nonmotorized Facilities, if the alternative eliminates the greenway between S 336th Street and S 344th Street this would have a significant impact as a north-south bicycle connection would not be possible and the majority of injury-related crashes involved pedestrians and cyclists along SR 99.	Please see responses to Comment IDs 61 and 26.
93	Page G1-88 - In section 4.2.3.8 Safety, the safety section should address if the project would impact intersections that already have a crash rate greater than 1.0 collisions per MEV. Additionally, this section should address non-motorized safety impacts associated with eliminating a north-south non-motorized connection.	Please see response to Comment ID 61.
94	Page G1-99 - In section 4.3.11 Estimation of Construction Truck Traffic, in addition to the impacts of truck activity, the impacts of trips related to workers traveling to and from the site should be quantified and discussed.	Please see response to Comment ID 28.
95	Page G1-104 - In section 4.3.1.6 Impacts to Nonmotorized Facilities, please clarify how long north-south connectivity would be impacted as pedestrians and cyclists would shift to SR 99 under this scenario.	Based on the anticipated construction schedule, the greenway currently along 20th Avenue S could be impacted for over 4 years. However, as stated in Final EIS Section 3.2.2.4, Avoidance and Minimization of Impacts (to Transportation), and Section 4.4, Avoidance and Minimization Measures, of Appendix G1, Transportation Technical Report, Sound Transit would require the contractor to develop a construction transportation management plan to address site access and traffic control, including for bicycles and pedestrians, in accordance with Federal Way requirements.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
96	Page G1-105 - In Section 4.3.1.7 Impacts to Parking, please clarify how many workers would be traveling to and from the site and if there would be sufficient parking on-site for all workers to park.	Please see response to Comment ID 29.
97	Page G1-122 - In section 4.7 Long Term Mitigation Measures, consistent with the executive summary, the City's street vacation process should be referenced as an ongoing coordination effort related to the reconfiguration of the street network.	Please see response to Comment ID 12.
98	**Social Resources, Community Facilities, and Neighborhoods** Page 3.6-8 - Belmor is a manufactured home community, zoned multifamily residential.	The sentence has been revised in Section 3.6.2.2 of the Final EIS to reflect this comment.
99	- Clarification is needed on the expected displaced residences. Provide methodology for calculating impacted residents and provide addresses.	As described in Section 3.3, Acquisitions, Displacements, and Relocations, of the Final EIS, Sound Transit used King County Assessor's data and aerial imagery in combination with the project operational and construction footprints to determine potential property impacts and displacements. In most cases, where the OMF South project footprint overlapped with a building (e.g., residence), it was assumed that the use would be displaced. The level of acquisition discussed in the EIS is provided for comparing alternatives. Estimates of displaced properties reflect the condition at the time the analysis was conducted. Because property uses change over time, the number and/or type of displacements could vary between what is described in the Final EIS and what would be required. Appendix H1, Potentially Affected Parcels, includes a table and maps showing the potentially affected parcels for each OMF South build alternative.
100	- What analysis went in to this conclusion? Airtime Aviation, Inc. is located in a custom designed building for the use. The impact to this business and others like it is inadequately evaluated.	The referenced text concerns the impacts of the Preferred Alternative to community cohesion. The Final EIS concludes that the displacement of businesses from the Preferred Alternative would not impact community cohesion due to the small size of the businesses and relative abundance of similar types of businesses in the study area.
101	Page 3.6-11 - In the environmental justice summary; country of origin and immigration status should also be considered.	The EJ analysis follows Executive Order 12898, U.S. Department of Transportation (DOT) Order on Environmental Justice, and the FTA Circular C-403.1. It uses definitions from the DOT order to define minority and low-income persons which are described in Section 1.1 of Final EIS Appendix E, Environmental Justice Assessment. FTA does not use country of origin or immigration status in its definition of EJ populations.

City of Federal Way (Communication ID 539072)

Comment ID	Comment Text	Response
102	**Economic and Fiscal Impacts** Page 3.5-1 - Clarification is required if the entire dataset in Section 3.5 “Economics” was calculated using King County level datasets or specific South King County Data Sets. South King County is defined as: Renton, Tukwila, SeaTac, Burien, Des Moines, Normandy Park, Kent, Auburn, and Federal Way.	As stated in Final EIS Section 3.5, Economics, regional economic activity, such as jobs and labor income, was evaluated for the Puget Sound region, including King, Kitsap, Pierce, and Snohomish counties. Potential displacement of business activity and tax revenues were evaluated at the city level for Federal Way and Kent. Economic data specific to only King County were not used in the evaluation.
103	- Using King County macro level data is not representative of the economic landscape of South King County as it relates to wages, demographics, type & size of industry, etc	See response to Comment ID 102.
104	**Land Use Impacts** There appear to be unaccounted for impacts from the preferred and S 344th St Alternatives related to affected parking, impacted businesses, and number of employees displaced. These need to be addressed. The use of the OMF site is inconsistent with the City's urbanizing vision. Address the lack of planning for a smaller footprint for the facility or planning for mixed use by either placing parking in structures thereby allowing for other use of a portion of the property or the use by others of air rights above any of the planned facilities. The possibility of such a project could offset the economic impact of prohibiting the development of 60 acres of strategically located commercial land to its highest and best use. Specific comments include:	These comments are addressed more specifically through responses to comments 105 through 107 below.
105	Page ES-11 Figure ES-4 - Apparent unaccounted for impact from the Preferred Alternative to the parking/loading in the northeast corner of the Spectrum Business Park. The EIS should determine if the required parking for the uses at the Spectrum Business Park will be impacted, reduced, or result in any non-conformance.	The reconstruction of S 340th Street (a private road) could require a temporary construction easement through the northeast corner of Spectrum Business Park. Neither the Preferred nor South 344th Street alternatives are anticipated to permanently impact parking or loading zones. The Spectrum Business Park is listed as a potentially affected parcel in Final EIS Appendix H-1.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
106	Page ES-19 - How was this calculated? What are the exact businesses that are being displaced? Is there a spreadsheet of this information? According to Washington State Department of Revenue there are significantly more 6 active business licenses that will be impacted. This misrepresentation also applies to the South 344th Street Alternative.	As stated in Section 3.3, Acquisitions, Displacements, and Relocations, of the Final EIS, Sound Transit used a geographic information system (GIS) to compare the proposed OMF South alternatives with King County parcel data and high-resolution aerial imagery to determine potential acquisitions and displacements for each build alternative. The potentially affected businesses were identified through King County assessor data and verified through windshield surveys, when possible, consistent with the EIS methodology reviewed by the city of Federal Way. As stated in Section 3.3, the level of acquisitions discussed provides information for comparing alternatives. Estimates of displaced properties reflect the conditions at the time the analysis was conducted. Because property uses change over time, the number and/or type of displacements could vary between what is disclosed in the Final EIS and what would be acquired.
107	- Provide methodology for how the number of employees impacted was calculated. These numbers do not accurately reflect the true number of active businesses that may be impacted and the actual number of impacted employees are likely underrepresented.	As explained in Final EIS Section 3.5, Economics, Table 3.5-5, Property Acquisition Impacts on Businesses and Employees (note 3), the number of displaced employees is based on the business building size (King County Department of Assessment data) and the type of business activity using square-foot-per-employee factors from the U.S. Department of Energy and the Institute for Transportation Engineers and not on an actual survey of businesses. The analysis for estimating employees assumes that the businesses are not abandoned or vacant.
108	**The following comments are related to Appendix C** Page 23 - Activation Zone parking spaces are not shown on this map, but shown in others. Plans should be consistent.	Please see response to Comment ID 32.
109	- This is the only time in the entire DEIS that the Activation Zone is mentioned, but does not include square footage, uses, benefits, impacts, etc. Additional information for the activation zone is required.	Please see response to Comment ID 32.
110	- Any impacts to existing uses shall be addressed including parking stall or loading zone displacement. The OMFS site shall not create any nonconformities.	Please see response to Comment ID 32.
111	- Maps should be consistent and the impacts to adjacent uses must be measured. It appears Spectrum Business Park parking is being displaced here. Provide more information on how these impacts will be mitigated and the creation of any nonconformities will be avoided.	Please see response to Comment ID 32.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
112	Page 27 • The activation zone should serve multi-modal travelers, including those arriving via vehicle. There must be parking available for the activation zone.	Please see response to Comment ID 32.
113	**The Following comments are related to Appendix H2** Page H2-2 • The reference information for the Federal Way Revised Code and Federal Way Comprehensive Plan are inaccurate and should be updated to reflect the current standards.	Section 1.2.2 of Final EIS Appendix H2, Land Use Technical Appendix, has been updated to reflect the current dates for local codes and comprehensive plans.
114	Page H2-3 • The preferred and South 344th St alternatives reference some smaller areas within the City Center Core land use designation. This is inaccurate and needs to be updated.	The mainline tracks are included as an element of both the Preferred and South 344th Street alternatives. The mainline tracks for both alternatives extend into The Commons at Federal Way mall and the S 320th Street Park & Ride, which are zoned City Center Core.
115	Page H2-4 • The section concerning the Tacoma Dome Link Extension is outdated and needs revision. Not mentioned here is the South Station Subarea Plan and the Countywide Growth Center Candidate Designation which should be included.	Appendix H2, Land Use Technical Appendix, has been revised in the Final EIS to include mention of the Countywide Growth Center Candidate designation and South Station Subarea Plan.
116	Page H2-5 – Table H2-1 • Please provide basis for calculation of 17 acres in the CC-C zone due to OMF impacts.	Acreages were calculated using GIS, overlaying the project boundaries on the zoning map.
117	• For the section concerning City of Federal Way Zone (RM-2400 and RM-3600: Multi-Family), it is not accurate to consider only a portion of the site as zoned multi-family. The preferred alternative is a majority zoned multi-family residential. Additionally, it is not appropriate to consider the OMF use as a Government Facility. Light rail or commuter rail transit facility require a Process IV review in the CC-C & CE zones.	Consistent with the comment, Section 1.3.1 of Appendix H2, Land Use Technical Appendix, to the Final EIS states, "The Preferred and South 344th Street alternatives are primarily within the Multi-Family Residential (RM) land use designation, in addition to smaller areas within Commercial Enterprise (CE), City Center Core (CC-C), and Commercial Business (CB) designations." Table H2-1 in Appendix H2, Land Use Technical Appendix, to the Final EIS has been updated to remove reference to the OMF as a government facility in the RM-2400 and RM-3600 zones and notes that it would be permitted as an essential public facility.
118	Page H2-6 – Table H2-1 • For the BC: Community Business and CE: Commercial Enterprise zones, the permitting use for the OMFS would be Public Transportation Facilities, per FWRC 19.240.135. Considering the OMF a “Government facility” is not accurate.	Table H2-1 in Appendix H2, Land Use Technical Appendix, to the Final EIS has been updated to remove reference to the OMF as a government facility in the BC and CE zones. The table notes that the OMF would be permitted as a light rail or commuter rail transit facility in the CE zone and as an essential public facility in the BC zone.

City of Federal Way (Communication ID 539072)		
Comment ID	Comment Text	Response
119	Page H2-12 – Table H2-5 - Under Policy LUP 9, the statement that the OMFS site supports light rail operation which would support mixed use development is misleading and inaccurate. The light rail stations support light rail operations. Having the OMF site in the City of Federal Way does not support mixed-use development any more than the OMF site being located at Midway Landfill does.	Reference to LUP9 has been deleted from Final EIS Appendix H2, Land Use Technical Appendix.
120	Page H2-13 – Table H2-5 - Under Topic 2.7 Land Use Designations (Single Family). For Policy LUP14, the mitigation steps should not only be used to support aesthetic compatibility between uses, and should extend to include additional impacts like noise/sound, light, vibration, etc.	The environmental analysis did not identify any noise, vibration, or light impacts to adjacent residents from operation of the OMF site. Please see Section 3.9, Noise and Vibration, and Section 3.7, Visual and Aesthetic Resources, of the Final EIS.
121	- Under Topic 2.7 Land Use Designations (Multi-Family). It is inaccurate to state that this project helps broaden transit options for multi-family households in the Federal Way area. The light rail stations support light rail operations. Having the OMF site in the City of Federal Way does not help broaden transit options for MF in the Federal Way area.	The proposed project supports Sound Transit’s goals to expand Link light rail service at planned service levels, including that provided by TDLE, which includes a station in South Federal Way. OMF South is necessary to support continued expansion of light rail service south through Federal Way to Tacoma.
122	Page H2-15 – Table H2-5 - The response provided for consistency with comprehensive Plan Policy LU40 is inappropriate. The policy is about the range of retail and supportive uses.	Comment acknowledged. The discussion of LU40 was removed from Final EIS Appendix H2, Land Use Technical Appendix.
123	**Visual and Aesthetic Resources** Page 3.7-7 - The i5 and Pac Hwy corridor in Federal Way consists of significant asphalt surfacing, removing trees within this area will have an increasingly negative impact on the City's urban heat index and citywide tree canopy coverage. Impacts to the urban heat index and the citywide tree canopy coverage should be evaluated between alternatives. Tree planting to meet the average Citywide canopy (35%) should be a target for this facility, if located in Federal Way.	Section 3.10, Ecosystems, of the Final EIS discusses the impacts associated with vegetation removal. Analysis of impacts to the urban heat index is not required by NEPA or SEPA and is not part of the methodology for the EIS that was reviewed by the city.
124	Page 3.7-11 – Figure 3.7-6 - The image shows redirected power lines. Confirm if this was intentional? Will they be redirected?	The power lines would be relocated.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
125	Page 3.7-16 – Figure 3.7-12 • The photo for the existing condition and simulation of proposed conditions appear to be the same. Confirm that no visual change is expected.	This Key Observation Point was selected because it is a major intersection near a site that would have a relatively large number of viewers. In the far right of the simulation, there is a new building shown.
126	Page 3.7-17 – Figure 3.7-14 • A cell tower appears to be removed in the simulation of proposed conditions. Confirm this removal and provide mitigation method for tower if removal is expected.	The tower is a broadcasting tower associated with the former office of Trinity Broadcasting, which no longer operates at this location.
127	**Noise and Vibration** Page 3.9-7 • Confirm the methodology and noise sources used in the noise analysis. Were the maintenance activity and testing of horns noise generators included in the projections?	As described in Final EIS Section 3.9, Noise and Vibration, and Appendix G2, Noise and Vibration Technical Report, Sound Transit modeled noise-generating activities that could be expected at the OMF site itself and on the mainline and test tracks. Noise and vibration from facility and mainline track operations were modeled using the methods described in the 2018 FTA Transit Noise and Vibration Impact Assessment Manual (FTA Report No. 0123). Noise-generating activities would include vehicles moving within the facility, vehicle washing and drying, a traction power substation, vehicles moving on the mainline track (for the Preferred Alternative and the S 344th Street Alternative) into service in the morning and back to the facility in the late evening, and operations on the test track. This included limited testing of train bells and horns. See Final EIS Section 3.9.2.2, Long-Term Impacts, Preferred Alternative.
128	• The evaluation of noise impacts shall measure and account for any increase in ambient Interstate 5 noise resulting from tree removal and sound barrier as part of the track construction for both the preferred and S 344th alternatives.	Potential impacts to noise walls are discussed in Final EIS Section 3.9, Noise and Vibration, under Section 3.9.2.2, Long-Term Impacts, Preferred Alternative. Modification of the existing berm and noise walls adjacent to I-5 would result in traffic noise impacts at about one to three residences in Belmor. Sound Transit would provide traffic noise mitigation measures where traffic noise levels are predicted to be above the 2042 No-Build levels from removal of the existing berm and noise wall. The limited number of tree removals would have no effect on noise levels.
129	**Ecosystems and Resources** Page 3.10-26 • Language indicates that ‘frontage improvements along S 336th Street to meet city standards may necessitate the installation of a replacement structure where West Fork Hylebos Tributary is crossed by the road.’ This should be changed to ‘must replace the culvert.’	Section 3.10, Ecosystem Resources, in the Final EIS has been clarified to say that the frontage improvements along S 336th Street would necessitate the installation of a replacement culvert at the crossing of West Fork Hylebos Tributary. Final design would confirm whether that specific structure would be affected and require replacement.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
130	Page 3.11-12 - Any impacts to wetlands related to the extension of 18th Place S shall be eliminated or demonstrated to the City that impacts have been minimized and mitigated.	Sound Transit will comply with all regulations concerning potential impacts to wetlands, including the federal 404(b)(1) analysis required by the Clean Water Act and City of Federal Way critical area ordinances. Avoidance and minimization of impacts will be part of the mitigation sequencing used during design and permitting of the project.
131	Page 3.11-19 - Any impacts to wetlands related to the extension of 18th Place S shall be eliminated or demonstrated to the City that impacts have been minimized and mitigated.	Please see the response to Comment ID 130.
132	**Cumulative Effects** Page 4-3 - There is a large tree canopy with mature trees that will be heavily impacted by the proposed 18th Place S extension as part of the preferred alternative. Currently as proposed neither OMFS sites in Federal Way will meet Tree retention requirements. Please address.	Potential impacts to vegetation are addressed in Section 3.10, Ecosystem Resources, and Section 3.7, Visual and Aesthetic Resources, in the Final EIS. If the Preferred Alternative is selected as the project to be built, Sound Transit will continue to work with Federal Way regarding city development requirements.
133	Page 4-8 - Within section 4.1 under transportation, the City Center Access Project for Federal Way is described as unfunded. This is incorrect, the construction phase is currently unfunded however the design and right of way is funded. Please adjust.	Section 4.4.1, Transportation, in Chapter 4, Cumulative Effects Analysis, in the Final EIS has been revised to reflect this comment.
134	Other sections of the report reference 610 jobs, rather than 470 jobs	The correction has been made to the Final EIS Fact Sheet.
135	City center access received funding for phase 1 design and ROW. I believe the Triangle Project also has current design funding.	The Final EIS has been modified to reflect this comment.
136	Why does the OMF site need to accommodate all of these LRVs when another OMF site is being planned for in the north. How is the OMF capacity being balanced across sites. A reduction in the minimum LRV capacity at OMFS should be able to reduce the land take, preserve more trees, reduce stream and wetland impact, and reduce impacts to neighboring residential uses.	As discussed in Section 2.1 of the Final EIS, Background and Project Development, Sound Transit 3 calls for a total fleet (existing plus new) of approximately 460 light rail vehicles (LRVs). To meet Sound Transit 3's system expansion goals, Sound Transit needs two additional operations and maintenance facilities: one in both the North and South Corridors. The proposed OMF South project will satisfy the need for an OMF in the South Corridor and LRV testing to support system expansion.
137	Why is preferred option most land intensive? 6 acres more than 344th St.	The acreage for each alternative is a function of the shape of the site and how efficiently the various OMF site components can fit within the site boundaries. As described in Final EIS Chapter 2, the Preferred Alternative is 66 acres, the South 344th Street Alternative is 64 acres, and the Midway Landfill Alternative is 68 acres.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
138	Although S 344th alternative has more facilities impacted, CFC is huge and this analysis does not access or account for the cumulative number of community members impacted.	The Final EIS discusses potential impacts to the Christian Faith Center in Section 3.3, Acquisitions, Displacements, and Relocations, and Section 3.6, Social Resources, Community Facilities, and Neighborhoods.
139	Provide methodology for calculating business displacement and provide list of those counted business. These number are under counting the true impacts	Please see the response to Comment ID 106.
140	Any changes to schedule beyond a standard 5 day, 8 hr daytime schedule will require approval by the City. Nighttime work may not be allowed due to proximity to residential properties.	Comment acknowledged.
141	[Section 3.2.1.4, in reference to “20th Avenue E”] S, not E	The error has been corrected in the Final EIS.
142	Routes 177 and 577 would still be faster than light rail for several years, so there will be opposition to discontinuing those routes.	Please see the response to Comment ID 8.
143	S 330th St is inappropriate for a haul route, as it is narrow, has a small traffic circle at 20th Ave S, and traverses residential areas with some areas of high parking utilization.	Please see the response to Comment ID 27.
144	S 330th St is not an acceptable haul route.	Please see the response to Comment ID 27.
145	[Chapter 4, Section 4.4.1] for construction. Design and R/W is funded.	Please see the response to Comment ID 135.
146	Intersections with a collision rate above 1.0 per MEV should be discussed in greater detail as to potential contributing factors. Additionally, the societal cost per MEV must be provided in the collision summary tables and discussed.	Please see the response to Comment IDs 4 and 5.
147	It is noted that the annual growth rate is based on the growth rate used for TDLE traffic studies, but please specify what the basis for the assumed TDLE annual growth rate was. Typically, a higher annual growth rate closer to 1.25 percent has been used in the City of Federal Way.	Please see the response to Comment ID 6.
148	Was this signal timing optimization vetted with WSDOT and/or City of Federal Way? Are there other external factors outside of the study area that would impact the ability to optimize the siganal timings?	Please see the response to Comment ID 7.
149	A more comprehensive trip generation sections needs to be provided in this report. The appendices do not include detailed calculations and the methodology outlined here does not match with the methodology outlined in the appendices (i.e. trip generation does not appear to account for delivery-related trips or other non-employee trips)	Please see the response to Comment ID 9.

City of Federal Way (Communication ID 539072)		
Comment ID	Comment Text	Response
150	Given that this is a long-range analysis, and that the evaluated alternatives result in major changes to the roadway network, it is not appropriate to base trip distribution assumptions on existing travel patterns along. Trip distribution patterns should be based on the regional travel model and adjusted as needed based on changes to the roadway network.	Please see the response to Comment ID 10.
151	It cannot be definitely stated that no new safety issues would be introduced and no existing safety issues would be exacerbated. Particularly given the elimination of north-south connectivity for non-motorized traffic in the South 344th Street Alternative.	Please see the response to Comment ID 11.
152	The City of Federal Way's street vacation process should be referenced as it relates to the currently proposed roadway network and potential ongoing coordination.	Please see the response to Comment ID 12.
153	This is not consistent with the provided site plan. The description and if applicable, the associated analysis should be updated.	Please see the response to Comment ID 50.
154	v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.	Please see the response to Comment ID 15.
155	Intersection 10 (SR 99/Driveway) is longer proposed as part of the preferred alternative.	Please see the response to Comment ID 16.
156	Additional new intersections and site access points are not included in the analysis and are not summarized in Table 3.2-6. All new site driveways and new intersections resulting from roadway extensions must be provided in this table.	Please see the response to Comment ID 17.
157	v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.	Please see the response to Comment ID 15.
158	55 seconds of delay would typically indicate LOS E conditions. Without Synchro worksheets provided, it cannot be definitely confirmed that there are no impacts at this intersection. Please clarify.	Please see the response to Comment ID 19.
159	Intersection 10 (SR 99/Driveway) is longer proposed as part of the preferred alternative.	Please see the response to Comment ID 16.
160	Additional new intersections and site access points are not included in the analysis and are not summarized in Table 3.2-7. All new site driveways and new intersections resulting from roadway extensions must be provided in this table.	Please see the response to Comment ID 17.

City of Federal Way (Communication ID 539072)		
Comment ID	Comment Text	Response
161	This figure should indicate the new roadway extensions that are part of the preferred alternative. Additionally, new intersections and site driveways must be included in the analysis and shown on the figure.	Please see the response to Comment ID 22.
162	The City of Federal Way's street vacation process should be referenced as it relates to the currently proposed roadway network and potential ongoing coordination.	Please see the response to Comment ID 12.
163	v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.	Please see the response to Comment ID 15.
164	If volume projections are included for intersection 10 (as shown on the previous figures), then the traffic operations results should be shown in this table.	Please see the response to Comment ID 25.
165	v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.	Please see the response to Comment ID 15.
166	If volume projections are included for intersection 10 (as shown on the previous figures), then the traffic operations results should be shown in this table.	Please see the response to Comment ID 25.
167	This figure should indicate the new roadway extensions that are part of the preferred alternative. Additionally, new intersections and site driveways must be included in the analysis and shown on the figure.	Please see the response to Comment ID 22.
168	This would have a significant impact as a north-south bicycle connection would not be possible and the majority of injury-related crashes involved ped and cyclists along SR 99	Please see the response to Comment ID 26.
169	In addition to the impacts of truck activity, the impacts of trips related to workers traveling to and from the site should be quantified and discussed.	Please see the response to Comment ID 28.
170	Please clarify how many workers would be traveling to and from the site and if there would be sufficient parking on-site for all workers to park.	Please see the response to Comment ID 29.
171	Consistent with the executive summary, the City's street vacation process should be referenced as an ongoing coordination effort related to the reconfiguration of the street network.	Please see the response to Comment ID 12.
172	this last sentence seems out of context with the paragraph. What 1,000 SF building?	There would be a building associated with the test track. The previous sentence in Final EIS Section 2.2.8, Design Updates, mentions a test track facility separate from the OMF site. The description of the 1,000-square-foot building pertains to that facility.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
173	How can environmental impacts from TDLE be considered part of the "no-build" alternative if TDLE does not have an approved environmental document?	Please see the response to Comment ID 1.
174	should this 3-year time period be updated to more current?	Comment pertaining to traffic safety data. Please see response to Comment ID 3.
175	Parking study needs to be updated from the FWLE EIS to be consistent with ability to remove stalls without replacement. Does this include stalls removed for S324th culvert and roadway grade construction?	Please see the response to Comment ID 14.
176	these photos look the same	Please see the response to Comment ID 125.
177	cell tower removed?	Please see the response to Comment ID 126.
178	Were the maintenance activity and testing of horns noise generators analyzed? Is this like a automatic car wash... those dryers are loud. Seems to only be analysis of train movement (squeal). Mitigation?	Please see the response to Comment ID 127.
179	this should be a MUST vs. may replace the culvert.	Please see the response to Comment ID 129.
180	18th Pl S should not be "blamed" for wetland impacts. The project needs site can be modified/reduced to NOT require impacts to the wetland west of the preferred site.	Please see the response to Comment ID 130.
181	*[comment to delete the word “may” in reference to replacing the culvert]*	Please see the response to Comment ID 129.
182	site design needs to eliminate wetland impacts related to 18th Pl S; need to avoid encroachment	Please see the response to Comment ID 130.
183	Apparent unaccounted for impact from the Preferred Alternative to the parking/loading in the northeast corner of the Spectrum Business Park. The EIS should determine if the required parking for the uses at the Spectrum Business Park will be impacted, reduced, or result in any non-conformance.	Please see the response to Comment ID 105.
184	How was this calculated? What are the exact businesses that are being displaced? Is there a spreadsheet of this information? According to Washington State Department of Revenue there are way more 6 active business licenses that will be impacted. This also applies to the South 344th Street Alternative	Please see the response to Comment ID 106.
185	Provide methodology for how the number of employees impacted was calculated. I am concerned these numbers do not accurately reflect the true number of active businesses that may be impacted and undercount the actual number of impacted employees.	Please see the response to Comment ID 107.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
186	Provide more information regarding how this conclusion was arrived to. Are there no sensitive receptors?	Table ES-1, Key Characteristics and Impacts of the Build Alternatives in the Executive Summary is a summary of the EIS analysis. Section 3.9, Noise and Vibration, of the Final EIS and Appendix G2, Noise and Vibration Technical Report, include the requested information.
187	Belmor is a manufactured home community, zoned multifamily residential.	Please see the response to Comment ID 98.
188	This is 14, what is the remaining 1 unit? Provide methodology for calculating impacted residents and provide addresses.	Section 3.6.2 of the Final EIS has been revised to say, “The OMF site would also displace 15 residences, composed of one four-unit multi-family residential property and 10 single-family residential properties, one of which has two separate houses.”
189	What analysis went in to this conclusion? Airtime Aviation, Inc. is located in a custom designed building for the use. The impact to this business and others like it is inadequately evaluated.	Please see the response to Comment ID 100.
190	County of origin, immigration status should also be considered.	Please see the response to Comment ID 101.
191	There is already a lot of asphalt and concrete between the i5 and Pac Hwy corridor in Federal Way, Removing trees within this area will have an increasingly negative impact on the City's urban heat index and citywide tree canopy coverage. Impacts to the urban heat index and the citywide tree canopy coverage should be evaluated between alternatives.	Please see the response to Comment ID 123.
192	Image shows redirected power lines. Confirm if this was intentional? Will they be redirected?	Please see the response to Comment ID 124.
193	The evaluation of noise impact should measure and account for any increase in ambient I5 noise caused from tree removal and sound barrier as part of the track construction.	Please see the response to Comment ID 128.
194	There is a large tree canopy with mature trees that will be heavily impacted by the proposed 18th Place S Extension as part of the Preferred alternative. Currently as proposed neither OMF sites in Federal Way will meet Tree Retention requirements	Please see the response to Comment ID 132.
195	Please clarify the basis for this standard as it is not specified in Attachment A.	Please see the response to Comment ID 49.
196	Please clarify the basis for this standard as it is not specified in Attachment A. Additionally, the City of Federal Way standards should be referenced here since they are based on v/c rather than LOS/delay.	Please see the response to Comment ID 49.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
197	Overall Comments: • The analysis provided does not adequately analyze the preferred and 344th Street alternatives as not all new driveways/intersections are included and/or incorrect driveways are included. Additionally, v/c must be recorded for all intersections including those along State Routes as the City of Federal Way controls these intersections. • There is insufficient information provided related to the existing land uses removed and traffic rerouted as a result of vacated streets. Supplemental trip generation analysis and volume figures should be provided to illustrate how these conditions impact the future volumes. Without this information it is not possible to validate the future volumes provided. • Additional attachments must be provided including detailed trip generation information for the OMF South site and existing land uses; traffic counts; and Synchro worksheets.	Please see the response to Comment ID 48.
198	The extension of 18th Place S is described as intersection S 336th Street as the fourth (NB) leg of the 18th Ave S/S 336th St intersection, but the conceptual site plan does not depict it in this way due to the creek. It is assumed that a four-leg intersection is not feasible here and therefore the description/analysis should be revised accordingly.	Please see the response to Comment ID 50.
199	Please clarify what "as applicable" means. For instance, was volume balancing between intersections a key factor?	Please see the response to Comment ID 51.
200	During the AM peak hour, existing volumes at intersections 6 and 9 have decreased as compared to the 2021 DEIS resulting in greater volume imbalances between intersections in some cases. Please explain the change from the 2021 DEIS to the 2023 ADEIS.	Please see the response to Comment ID 52.
201	v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.	Please see the response to Comment ID 15.
202	v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.	Please see the response to Comment ID 15.
203	While it is acceptable to use collision data from 2016 to 2018 because collision data during the pandemic was atypical, many studies have found that collision rates were higher during the pandemic. Therefore it may not be accurate to say that 2016 to 2018 collision data is more conservative.	Please see the response to Comment ID 54.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
204	Intersections with a collision rate above 1.0 per MEV should be discussed in greater detail as to potential contributing factors. Additionally, the societal cost per MEV must be provided in the collision summary tables and discussed.	Please see the response to Comment ID 4 and 5.
205	It is noted that the annual growth rate is based on the growth rate used for TDLE traffic studies, but please specify what the basis for the assumed TDLE annual growth rate was. Typically, a higher annual growth rate closer to 1.25 percent has been used in the City of Federal Way.	Please see the response to Comment ID 6.
206	Was this signal timing optimization vetted with WSDOT and/or City of Federal Way? Are there other external factors outside of the study area that would impact the ability to optimize the siganal timings?	Please see the response to Comment ID 7.
207	v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.	Please see the response to Comment ID 15.
208	v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.	Please see the response to Comment ID 15.
209	Given that this is a long-range analysis, and that the evaluated alternatives result in major changes to the roadway network, it is not appropriate to base trip distribution assumptions on existing travel patterns along. Trip distribution patterns should be based on the regional travel model and adjusted as needed based on changes to the roadway network.	Please see the response to Comment ID 10.
210	A more comprehensive trip generation sections needs to be provided in this report. The appendices do not include detailed calculations and the methodology outlined here does not match with the methodology outlined in the appendices (i.e. trip generation does not appear to account for delivery-related trips or other non-employee trips)	Please see the response to Comment ID 9.
211	Please specify the approximate number of parking spaces this represents for each alternative.	Please see the response to Comment ID 60.
212	This section should address the intersections with a collision rate over 1.0 collisions per MEV and discuss how the project may impact these locations. Additionally, if north-south non-motorized facilities would not be feasible as part of the 344th Street Alternative, safety would not improve for non-motorized users and could in fact worsen. Please elaborate.	Please see the response to Comment ID 61.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
213	Information regarding existing land uses to be removed and associated trip generation projections for those uses need to be provided in this section.	Please see the response to Comment ID 64.
214	This is not consistent with the provided site plan. The description and if applicable, the associated analysis should be updated.	Please see the response to Comment ID 50.
215	The City of Federal Way's street vacation process should be referenced as it relates to the currently proposed roadway network and potential ongoing coordination.	Please see the response to Comment ID 12.
216	In addition to trip assignment, trip distribution figures should be included. Alternatively, trip distribution percentages could be illustrated on this figure (Figure G1.4-7)	Please see the response to Comment ID 65.
217	This figure should indicate new roadway extensions that are part of the preferred alternative.	Please see the response to Comment ID 66.
218	This figure shows intersection 10 as a new intersection, but intersection 10 no longer exists as part of the preferred alternative site plan based on Figure G1.1-2 and the roadway network description. If this driveway no longer exists, the volumes going through this intersection would need to be routed to other site access points and other study area intersections. Additionally, this figure does not show intersection 11 (18th Place S Extension/S 336th Street), but intersection is included in the LOS tables. Finally, the intersections of 21st Avenue S/S 341st Place and 21st Avenue S Extension/S 344th Street should be included in the analysis as well as future volume figures. Overall, the analysis provided does not sufficiently analyze the operational impacts of the preferred alternative.	Please see the response to Comment IDs 67, 68, and 69.
219	This figure should indicate new roadway extensions that are part of the preferred alternative.	Please see the response to Comment ID 69.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
220	This figure shows intersection 10 as a new intersection, but intersection 10 no longer exists as part of the preferred alternative site plan based on Figure G1.1-2 and the roadway network description. If this driveway no longer exists, the volumes going through this intersection would need to be routed to other site access points and other study area intersections. Additionally, this figure does not show intersection 11 (18th Place S Extension/S 336th Street), but intersection is included in the LOS tables. Finally, the intersections of 21st Avenue S/S 341st Place and 21st Avenue S Extension/S 344th Street should be included in the analysis as well as future volume figures. It is also not clear how the rerouted vehicles from roadway closures are accounted for. For example, the no-build conditions show 85 vehicles exiting 20th Avenue S during the PM peak hour. However, there are only 15 additional right turns at intersection 1 and no additional left turns beyond project trips. While volumes for intersection 11 are not shown, based on the future volumes at intersection 1, it does not appear that additional trips are routed to intersection 11. If these trips would no longer exist due to land uses being removed, it is not clear from this analysis as no trip generation fore existing land uses to be removed is provided. A figure showing how existing traffic was removed and rerouted should be included. Overall, the analysis provided does not sufficiently analyze the operational impacts of the preferred alternative.	Please see the response to Comment IDs 70, 71, 72, and 73.
221	Intersection 10 (SR 99/Driveway) is longer proposed as part of the preferred alternative.	Please see the response to Comment ID 74.
222	Additional new intersections and site access points are not included in the analysis and are not summarized in Table G1.4-10. All new site driveways and new intersections resulting from roadway extensions must be provided in this table.	Please see the response to Comment ID 76.
223	v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.	Please see the response to Comment ID 15.
224	This figure should indicate the new roadway extensions that are part of the preferred alternative. Additionally, new intersections and site driveways must be shown on the figure.	Please see the response to Comment ID 77.
225	55 seconds of delay would typically indicate LOS E conditions. Without Synchro worksheets provided, it cannot be definitely confirmed that there are no impacts at this intersection. Please clarify.	Please see the response to Comment ID 19.

City of Federal Way (Communication ID 539072)		
Comment ID	**Comment Text**	**Response**
226	Intersection 10 (SR 99/Driveway) is longer proposed as part of the preferred alternative.	Please see the response to Comment ID 16.
227	Additional new intersections and site access points are not included in the analysis and are not summarized in Table G1.4-10. All new site driveways and new intersections resulting from roadway extensions must be provided in this table.	Please see the response to Comment ID 17.
228	v/c must be recorded for all intersections, including those along State Routes. City of Federal Way is in control of these intersections and therefore the v/c standard applies to them.	Please see the response to Comment ID 15.
229	This figure should indicate the new roadway extensions that are part of the preferred alternative. Additionally, new intersections and site driveways must be shown on the figure.	Please see the response to Comment ID 77.
230	It should be more clearly defined where and what bicycle and pedestrian improvements are proposed as part of the preferred alternative.	Please see the response to Comment ID 82.
231	The safety section should address if the project would impact intersections that already have a crash rate greater than 1.0 collisions per MEV.	Please see the response to Comment ID 61.
232	Information regarding existing land uses to be removed and associated trip generation projections for those uses need to be provided in this section.	Please see the response to Comment ID 64.
233	The City of Federal Way's street vacation process should be referenced as it relates to the currently proposed roadway network and potential ongoing coordination.	Please see the response to Comment ID 12.
234	In addition to trip assignment, trip distribution figures should be included. Alternatively, trip distribution percentages could be illustrated on this figure (Figure G1.4-11)	Please see the response to Comment ID 85.
235	Intersection 10 is mislabeled for both AM and PM peak hours	Please see the response to Comment ID 86.
236	If Intersection 1 is only providing access to the Christian Faith Church under build conditions, and little to no project trips are projected it is unlikely that this intersection would observe as much traffic as it does today. This analysis does not sufficiently account for (or sufficiently document) traffic that would be rerouted from 20th Avenue S due to the closure. As such, this analysis may not adequately take into account additional impacts along SR 99 or 16th Street as a result. More broadly, a figure showing how existing traffic was removed and rerouted should be included.	Please see the response to Comment ID 87.

City of Federal Way (Communication ID 539072)

OMF South NEPA DEIS OOH Comment 2

09/22/2023

The shrub scrub wetlands and forested wetland to the west of the new proposed road in the preferred alternative really should be maintained and improved as mitigation for the projects rather than turned to landscaping and buying into a mitigation bank elsewhere or attenpting mitigation elsewhere. Impacts to the hylebos watershes should also be mitigated within the watershed to improve water storage and fish passage especially since this project has so many impacts within the watershed. Additional flood storage should be planned for for the likely beaver deonfliction that will arise in the future along that section of the stream in the project site as well. Since this project has also disproportianately impacted so many low income and protected people in the South sound particularly compared to the north and east extensions, special consideration should be given to the people sound transit continues to displace from their homes and value assessments from 3rd party assessors should be made more accessible as should the process to counter the valuations provided by sound transits assessors. Furthermore, in the interest of sound transit being better stewards of tax payer funds, additional consideration to staying within budget, and measures for staying within budget when unforseen project challenges arise should be implemented into the project contracts.

Anonymous/OOH (Communications ID 537207)		
Comment ID	**Comment Text**	**Response**
1	The shrub scrub wetlands and forested wetland to the west of the new proposed road in the preferred alternative really should be maintained and improved as mitigation for the projects rather than turned to landscaping and buying into a mitigation bank elsewhere or attempting mitigation elsewhere. Impacts to the Hylebos watershed should also be mitigated within the watershed to improve water storage and fish passage especially since this project has so many impacts within the watershed. Additional flood storage should be planned for for the likely beaver deonfliction that will arise in the future along that section of the stream in the project site as well.	Please see the response to Common Comment 3 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	Since this project has also disproportionately impacted so many low income and protected people in the South sound particularly compared to the north and east extensions, special consideration should be given to the people sound transit continues to displace from their homes and value assessments from 3rd party assessors should be made more accessible as should the process to counter the valuations provided by sound transits assessors.	Please see the response to Common Comment 2 in Table L.1-1, Responses to Common Comments, in the Final EIS.
3	Furthermore, in the interest of sound transit being better stewards of tax payer funds, additional consideration to staying within budget, and measures for staying within budget when unforeseen project challenges arise should be implemented into the project contracts.	Sound Transit will implement measures to control costs and manage the budget throughout the design and construction phases of the project. These include risk assessments, value management reviews, and value engineering evaluations and conditions in the contract for contract amendments, change orders, and unforeseen circumstances.

OMF South NEPA DEIS OOH Comment 3

09/22/2023

Jacob Davidson

Hi. I live at 1830 S. 336th St in federal way. I'm Really concerned about this project effecting traffic and and damage to our natural areas. We have creeks and West lands. I'm also concerned that the noise from the facility will be horrible and affect my quality of life. The traffic and dust from semi is also a concern. It seems mid way would be the best option as it affects the least amount of people. I'm concerned my property value will go down, I won't be able to sell if i wanted. What will sound transit to to mitigate the affects of our property. The noise during construction and after, traffic property values. I'm very concerned that the facility will be noise 24 7 and have a negative affect on our quality of life. I would ask for more trees to be planted around facility and along 336th as well as requesting a noise study. Being we would be directly across for the facility we may need to upgrade our windows and insulation to ensure our homes are unchanged as far ad noise. .

Jacob Davidson (Communications ID 537209)

1	I live at 1830 S. 336th St in federal way. I'm Really concerned about this project effecting traffic and damage to our natural areas. We have creeks and West lands.	Please see the response to Common Comment 3 in Table L.1-1, Responses to Common Comments, and Section 3.10, Ecosystems, of the Final EIS for more detail about impacts and mitigation measures concerning natural resources. Please see Section 3.2, Transportation, for more detail about anticipated impacts and mitigation measures concerning traffic.
2	I'm also concerned that the noise from the facility will be horrible and affect my quality of life.	Please see response to Comment ID 5 below.
3	The traffic and dust from semi is also a concern.	Potential construction impacts are addressed in Section 3.2, Transportation, and Section 3.8, Air Quality, in the Final EIS. The contractor would be required to use project controls and best management practices to reduce impacts to air quality, including dust.
4	It seems mid way would be the best option as it affects the least amount of people.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
5	I'm very concerned that the facility will be noise 24 7 and have a negative affect on our quality of life. I would ask for more trees to be planted around facility and along 336th as well as requesting a noise study. Being we would be directly across for the facility we may need to upgrade our windows and insulation to ensure our homes are unchanged as far ad noise.	As part of the EIS, Sound Transit conducted a noise and vibration analysis. The findings of the analysis are summarized in Section 3.9, Noise and Vibration, of the Final EIS and described in more detail in Appendix G2, Noise and Vibration Technical Report. Based on the current design, the OMF South facility for all the alternatives would not have noise impacts to nearby sensitive receptors. Noise impacts from the mainline guideway would be mitigated following Sound Transit's Link Light Rail Noise and Vibration Policy. Section 3.7, Visual and Aesthetic Resources, includes simulations that show the proposed landscaping for the site, which includes a large number of trees and other vegetation to help screen the facility from view.

OMF South NEPA DEIS OOH Comment 4

09/23/2023

Please put the OMF on the Midway landfill site. This is exactly the type of government project that is worth spending the additional time and dollars for. Look at how many business, residences are not displased, and how many streams and wetlands are not impacted. This site would probably never be used for private business and will remain under utilzed and an eyesore for decades to come. The alternative sites could make a bigger impact to mass transit by being rezoned for MFH, with quick access to mass transit/light rail access. Thank you.

2	The alternative sites could make a bigger impact to mass transit by being rezoned for MFH, with quick access to mass transit/light rail access.	The OMF is a maintenance facility and would not provide any public access to the Link light rail system. Zoning and comprehensive plan designations are discussed in Section 3.3, Land Use, of the Final EIS. Note that Sound Transit does not have jurisdiction over local agency zoning.

OMF South NEPA DEIS OOH Comment 5

09/23/2023

Please reconsider the Midway site for your primary site. The environmental, residential, and business impact is minimal compared to the other sites. This is how we want government to spend funds, utilizing sites that the public sector won't. Who is going to buy that eyesore? You don't have to tear down any trees or take away any wetlands. I know there is other considerations but I really think it is a better utilization of space for both communities

Eric Johnson,Eric Johnson

Amphibian populations are declining worldwide, and amphibians are experiencing high extinction rates due to habitat loss, chytrid fungus, pollutants, pesticides, and climate change. Amphibians are the most threatened class of vertebrates and merit special attention in the Sound Transit Operations and Maintenance Facility South Project Environmental Impact Statement (EIS). The EIS should identify amphibian habitat and potential impacts to amphibians. Where possible, the project should minimize impacts to wetland, stream, and forest habitats. The project's proposed detention and treatment of stormwater runoff appears to be a good practice to protect water quality and reduce impacts to amphibians. References: Catenazzi, A. 2015. State of the World's Amphibians. Annual Review of Environment and Resources, 40, 911-119 Collins, J.P., and M.L. Crump. 2009. Extinction in Our Times: Global Amphibian Decline. The City of Federal Way Public Works Department often creates roadblocks to allowing projects within the City to complete quickly and efficiently which results in increased impacts to the traveling public and also increased environmental impacts due to longer project durations. These additional City requirements also result in added costs to taxpayers. What is ST doing to preemptively avoid this as part of the EIS and pre-project planning?

I recognize that the Christian Faith Center site is preferred for a variety of good reasons ... not the least of which is cost. But I drive/walk by the abandoned Midway Landfill nearly every day and it is hard not to want to see it put to use. I think that is why you can't escape it remaining on the list. So, I have a suggestion. Instead of pouring over a billion dollars into that site, why don't you find a way to spend a million and turn it into a simple public park. Maybe there is an easy way to make it a useful space which would change it's image from "abandoned and vacant lot" to "community asset."   Our community benefits and you save millions of dollars and get to move on from this issue.

Bill Pugnetti

“Following the presentation today, I see the comment on impacts on businesses and residences and persons of different backgrounds, and it appears that the non minority person carries more weight than the majority person. Excuse me. It appears that the minority person carries more weight in considerations than a majority person. That seems like a level of discrimination and unbalanced consideration between the parties, so I'd like to call you out on that matter. That's an unbalanced approach. It's not individual by individual, but it's racial or other grounds that some persons are worth more than others in considering the handling of the project, so I see an unbalanced approach and a level of discrimination there. Thank you.”

Bill Pugnetti (Communications ID 538475 and 538479)		
Comment ID	**Comment Text**	**Response**
1	Stepping back from any one of the three OMFS alternatives and considering them overall. It appears the driving force behind building any one of them is support of operations from Federal Way on south. Which is predominately Pierce County. Given that Pierce County residents voted 'NO' on ST3, by what authority Legal - Constitutional (United States and Washington) - Moral - other is Sound Transit able to disregard the vote of Pierce County residents ?	OMF South would service the overall Sound Transit 3 system expansion in Pierce, Snohomish, and King counties. Sound Transit 3 was a regional measure that voters approved funding for in 2016.
2	Following the presentation today, I see the comment on impacts on businesses and residences and persons of different backgrounds, and it appears that the non minority person carries more weight than the majority person. Excuse me. It appears that the minority person carries more weight in considerations than a majority person. CAUTION: This email originated from a contact outside Sound Transit. Remember, do not click any links or open any attachments unless you recognize the sender and know the content is safe. Report any suspicious email by clicking the “fish” button in Outlook. Thank you! ST Information Security

Your first choice to locate the O&M Facility is on the property currently being used by the Christian Faith Center, So 336th St and So 344th St, Federal Way. This is the wrong location for such an operation. As the Washington State Tribes stated in 2021: Tens of millions of dollars were spent on property acquisition, habitat, restoration, contaminant, cleanup sites, and stream enhancements located downstream below the 336th – 344th sites. Pipelines and underground drainage conveyances offer no means of water treatment or groundwater recharge whatsoever, and are therefore viewed as incompatible with fish recovery. Many reaches of the Hylebos Creek that were formally whetted year-round are now EPHEMERAL. Reduced flow conditions are more susceptible to thermal inputs and rapid heating which puts additional stress on fish populations. Any further loss of water treatment opportunities and recharge are not an acceptable option for the tribes.

Your last choice to locate the Facility is the Midway Landfill. The cities of Kent, Des Moines and Federal Way stand in unison and approve the Midway landfill location.

I believe that the Midway Landfill is the best location for this Facility. The contaminated soil needs to be completely removed. This would be similar to the Superfund site in Tacoma where the Asarco smelter left a toxic legacy in the soil, groundwater, and sediments in Puget Sound. The cleanup began in 1983 and continues to this day. The Midway contaminated soil needs to be completely removed, not covered over.

In conclusion, the wetlands of the Hylebos Creek need to be protected, and the Midway landfill needs to be completely removed and put to better use. One better use would be your Facility.

Sincerely, Susan Strong

FW Resident since 1975, Born in Seattle

November 6, 2023

To: OMF South @ Erin Green

Sound Transit

401 Jackson Street

Seattle, WA 98104

I am writing to you today in full opposition to both potential OMF sites (S. 336th St. & S. 344th St.) here in the city of Federal Way.

The Puyallup Tribe has emphatically stated that pipelines and underground drainage conveyances offer NO means of water treatment or ground water recharge whatsoever and therefore are viewed as incompatible with fish recovery. Regardless of whether fish travel up to this area, it is the microbenthic vertebrae (food) that must travel via rocks, trees, and water to reach the lower reaches of the Hylebos East branch that must sustain healthy salmonoids. The tribes have spent tens of millions of dollars on property acquisitions, restoration plans, habitat restoration, stream enhancements and contaminant cleanup sites on lands that sit below the S. 336th St. and S. 344th St. sites. Loss of water treatment opportunities and recharge are NOT an acceptable option for the tribe. As stewards of these lands since time memorial, I support the Puyallup Tribes Sovereignty for preservation.

We are a small city of only 22 Square miles. Sound Transit has recently taken over and built their transit light rail station at our cities core at S. 320th. Expected build out of another transit transfer station and parking garage is planned for our south end (location to be determined) resulting in more considerable business and traffic impacts. Now the citizens of Federal Way are expected to sacrifice not one but two possible locations in our midtown. It is unacceptable to expect that our city is to accommodate all of Sound Transits needs.

These two sites were studied by Sound Transit as having a higher percentage of low-income and minority persons than the Sound Transit service district and King County. Displacement of community facilities, daycares and housing would further exploit and fortify their economic struggle. To assume that an industrial build such as the proposed 67-acre OMF facility would offset the impacts to the minority population because they would benefit from riding the train is absurd. They would still have to travel outside of their area to utilize a transfer station. Causing them time and money. There are sufficient bus line options already in place.

There simply is no M2 or M3 (heavy industries that generate noise, traffic, or pollutants) zoning here in the city of Federal Way. This unseeming and inconsistent development would have devastating/catastrophic effects on businesses like Ellanos Yogurt, N.W. Equipment Sales/Rentals, Garage Town, Voice of Hope Church, Family Life Community Church, Christian Faith Church and associated schools, Redwood Church of God, and Tabernacle Temple of Praise Church.

Assumptions are being made by Sound Transit that our Comprehensive Plan policies of converting our only light industrial zone in Federal Way (S. 344th St.), vacating public roads and modifications of development standards will be permitted. The Transportation Technical report is riddled with needed corrections and clarification, as well as disregarding emergency vehicles the ability to use S. 20th Ave. The suggested solution to bulldoze a road through a critical class 5 wetland is not an acceptable option as our water district operates within this area, serves as an aquifer recharge area and is home to numerous wildlife species.

The S. 336th St. option runs with a never-ending Concomitant Agreement, that is not negotiable, and as Christian Faith owners stated in their 2021 letter, "we have commitments to stormwater management, site access, mitigation, and recreational areas. A reminder that this land is a part of the iconic Weyerhaeuser Campus, in which visual impacts were NOT adequately addressed in previous Draft statements. The Christian Faith land WAS already mitigated in 1994 and it was the citizens who fought for four long years to preserve the functionality of the Hylebos Creek, surrounding tributaries and wetlands. It should not be allowed to be mitigated again. This is a Corporate Park zoning with highly sensitive areas, that do not warrant a Heavy Industrial Equipment zoning. Noise and vibration impacts will be considerably undesirable and unhealthy for residents and wildlife, as the open spaces, creek and native forests provide food, water, and shelter as it is a part of the International Flight Pathway. 150 migrating species depend on these resources.

Sound Transit, King County and the city of Federal Way must consider the cumulative impacts of future developments within the Hyebos Watershed. Hylebos Watershed and Lower Puget Sound Plan must be included and thoughtfully considered. Numerous large developments such as the two warehouses built recently on the Weyerhaeuser Campus has already negated a head water tributary, that fed not only the Hylebos, but the Duwamish/Green River Watersheds. Any further demolition of the Hylebos East Branch Creek will surely lead to its demise.

The cities of Kent, Des Moines and Auburn are in favor of the Midway landfill as **The Preferred** OMF site. They stand in opposition with the city of Federal Way for the construction of the OMFSouth at either of these locations. The landfill is a most doable site, if the Federal government or the state would be invited to assist in the funding. Sound Transit should exhaust every available option before it forever displaces our citizens, businesses, environment, aquifer, and high quality of life here in Federal Way.

The Executive Summary consistently refers to the S. 336th Site as THE PREFERRED site which feels like a deliberate attempt to persuade the reader/voting public. I do not feel this is a fair representation of the three options before us.

I urge Sound Transit to reconsider the two previous site options in Fife, as the zoning would permit a heavy industrial equipment build. These two options were dismissed to quickly, due to a lag of a mere 22 seconds in train journey travel in regards to reaching its set destinations. Surely this can be managed by the experts of Sound Transit, and should be a priority task moving forward.

Kerry Lesinski (Communications ID 539016)

1	I am writing to you today in full opposition to both potential OMF sites (S. 336th St. & S. 344th St.) here in the city of Federal Way.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	The Puyallup Tribe has emphatically stated that pipelines and underground drainage conveyances offer NO means of water treatment or ground water recharge whatsoever and therefore are viewed as incompatible with fish recovery. Regardless of whether fish travel up to this area, it is the microbenthic vertebrae (food) that must travel via rocks, trees, and water to reach the lower reaches of the Hylebos East branch that must sustain healthy salmonoids. The tribes have spent tens of millions of dollars on property acquisitions, restoration plans, habitat restoration, stream enhancements and contaminant cleanup sites on lands that sit below the S. 336th St. and S. 344th St. sites. Loss of water treatment opportunities and recharge are NOT an acceptable option for the tribe. As stewards of these lands since time memorial, I support the Puyallup Tribes Sovereignty for preservation.	Please see the response to Common Comment 3 in Table L.1-1, Responses to Common Comments, in the Final EIS. Final EIS Section 3.10, Ecosystem Resources, and Appendix G3, Ecosystems Resources Technical Report, further detail the impacts and avoidance, minimization, and mitigation measures concerning Hylebos Creek.
3	We are a small city of only 22 Square miles. Sound Transit has recently taken over and built their transit light rail station at our cities core at S. 320th. Expected build out of another transit transfer station and parking garage is planned for our south end (location to be determined) resulting in more considerable business and traffic impacts. Now the citizens of Federal Way are expected to sacrifice not one but two possible locations in our midtown. It is unacceptable to expect that our city is to accommodate all of Sound Transits needs.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
4	These two sites were studied by Sound Transit as having a higher percentage of low-income and minority persons than the Sound Transit service district and King County. Displacement of community facilities, daycares and housing would further exploit and fortify their economic struggle. To assume that an industrial build such as the proposed 67-acre OMF facility would offset the impacts to the minority population because they would benefit from riding the train is absurd. They would still have to travel outside of their area to utilize a transfer station. Causing them time and money. There are sufficient bus line options already in place.	Sound Transit and FTA have updated Final EIS Appendix E, Environmental Justice Assessment, and Section 3.6, Environmental Justice, Social Resources, Community Facilities, and Neighborhoods, to discuss in greater detail the potential impacts to minority and low-income populations as well as project mitigation and benefits. After consideration of the additional analysis, FTA maintains the preliminary determination that OMF South would not result in disproportionately adverse effects on environmental justice populations.

Comment ID	**Comment Text**	**Response**
5	There simply is no M2 or M3 (heavy industries that generate noise, traffic, or pollutants) zoning here in the city of Federal Way. This unseeming and inconsistent development would have devastating/catastrophic effects on businesses like Ellanos Yogurt, N.W. Equipment Sales/Rentals, Garage Town, Voice of Hope Church, Family Life Community Church, Christian Faith Church and associated schools, Redwood Church of God, and Tabernacle Temple of Praise Church. Assumptions are being made by Sound Transit that our Comprehensive Plan policies of converting our only light industrial zone in Federal Way (S. 344th St.), vacating public roads and modifications of development standards will be permitted.	An OMF would not have the same effects as a heavy industrial facility. The potential impacts of OMF South for the topics mentioned in the comment are described in Section 3.2, Transportation, and Section 3.9, Noise and Vibration, of the Final EIS.
6	The Transportation Technical report is riddled with needed corrections and clarification, as well as disregarding emergency vehicles the ability to use S. 20th Ave.	Appendix G1, Transportation Technical Analysis, and Section 3.2, Transportation, of the Final EIS have been updated to correct errors that were identified in the public comments. Potential impacts to emergency vehicle response times under the Preferred and South 344th Street alternatives are discussed in Section 3.14, Public Services.
7	The suggested solution to bulldoze a road through a critical class 5 wetland is not an acceptable option as our water district operates within this area, serves as an aquifer recharge area and is home to numerous wildlife species. The S. 336th St. option runs with a never-ending Concomitant Agreement, that is not negotiable, and as Christian Faith owners stated in their 2021 letter, “we have commitments to stormwater management, site access, mitigation, and recreational areas. A reminder that this land is a part of the iconic Weyerhaeuser Campus, in which visual impacts were NOT adequately addressed in previous Draft statements. The Christian Faith land WAS already mitigated in 1994 and it was the citizens who fought for four long years to preserve the functionality of the Hylebos Creek, surrounding tributaries and wetlands. 8	Sound Transit, King County and the city of Federal Way must consider the cumulative impacts of future developments within the Hylebos Watershed. Hylebos Watershed and Lower Puget Sound Plan must be included and thoughtfully considered. Numerous large developments such as the two warehouses built recently on the Weyerhaeuser Campus has already negated a head water tributary, that fed not only the Hylebos, but the Duwamish/Green River Watersheds. Any further demolition of the Hylebos East Branch Creek will surely lead to its demise.	Chapter 4, Cumulative Effects Analysis, discusses the potential cumulative impacts to each element of the environment, including ecosystem resources.
9	The cities of Kent, Des Moines and Auburn are in favor of the Midway landfill as The Preferred OMF site. They stand in opposition with the city of Federal Way for the construction of the OMF South at either of these locations. The landfill is a most doable site, if the Federal government or the state would be invited to assist in the funding. Sound Transit should exhaust every available option before it forever displaces our citizens, businesses, environment, aquifer, and high quality of life here in Federal Way.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
10	I urge Sound Transit to reconsider the two previous site options in Fife, as the zoning would permit a heavy industrial equipment build. These two options were dismissed to quickly, due to a lag of a mere 22 seconds in train journey travel in regards to reaching its set destinations. Surely this can be managed by the experts of Sound Transit, and should be a priority task moving forward.	The Fife sites were eliminated from further consideration because they are farther than 1.5 miles south of the FWLE terminus and would not be able to efficiently connect to an operating light rail mainline track when OMF South opens. The complete results of the alternatives evaluation are summarized in the OMF South Alternatives Technical Memorandum (Sound Transit 2019c).

1	I live in Belmor Park. I have lived 4 years there. I would not be affected but I am deeply concerned about the traffic effect, noise as to daytime	Final EIS Section 3.2, Transportation, and Section 3.9, Noise and Vibration, discuss traffic and noise impacts. No traffic or noise impacts were identified from OMF operations. Noise from LRVs traveling along the mainline would be fully mitigated. Modification of the existing berm and noise walls adjacent to I-5 would result in traffic noise impacts at about one to three residences in Belmor. Sound Transit would provide traffic noise mitigation measures where traffic noise levels are predicted to be above the 2042 No-Build levels from removal of the existing berm and noise wall.
2	I understand people are being removed and Belmor isn't cooperating as I know many have asked to have the mobiles moved elsewhere in the park, but were told no open spots to move them plus some of the older people can't afford to move and increase their debt I hope that Sound Transit pay them and not make them homeless.	Final EIS Section 3.3.4, Sound Transit Acquisition and Relocation Policy Summary, outlines the process for compensation of property owners.

1	A wall should be more than 4' if I look at my window and can wave at everyone. The rail likes like it's going over homes in the park. Is this the case?	The mainline track options for the Preferred and South 344th Street alternatives would be elevated mainline through the north end of Belmor before descending in elevation to travel at grade or on a retained fill slope through the south end of Belmor. The mainline would not travel directly over or immediately adjacent to any homes. Please see Figure 3.7-5 in Final EIS Section 3.7, Visual and Aesthetic Resources, for a conceptual rendering of the elevated mainline tracks through Belmor.

I just needed to let you know how you are affecting my family and many others. I think it's disgraceful!	Section 3.3.4, Sound Transit Acquisition and Relocation Policy Summary, outlines the process for compensation of property owners. The proposed mainline alignment location was determined through the TDLE alternative evaluation process, as detailed in the Tacoma Dome Link Extension Level 2 Alternatives Evaluation Report (Sound Transit 2019). Alternative alignments were ranked based on their ability to meet objectives, including (1) providing effective transportation solutions to meet mobility, access, and capacity needs; (2) supporting sustainable land use plans, transit-oriented development, and multimodal station access; (3) preserving the environment; and (4) supporting equitable mobility.

My Name is Patricia M. Pugnetti – Born in Tacoma almost 75 years ago I remember my father reading the paper every night. We discussed what would happen to the Land fill area. I remember him saying that the city "fathers" were going to ~~use~~ relocate the "land fill area" for some special use that would benefit the citizen in the years to come. That was in the late 50's & 60's. We've waited all these years. Why not use it now! That we are not displacing homeowner or business. Yes I realize it cost more, but our representative seem to find push what they want through ~~the~~ dispite what others ~~what~~ want. Why not use this property Now.

Operations & Maintenance & Facility Location

Bob Strong [redacted]
Mon 11/6/2023 3:32 PM
To:OMF South <OMFsouth@soundtransit.org>

CAUTION: This email originated from a contact outside Sound Transit. Remember, do not click any links or open any attachments unless you recognize the sender and know the content is safe. Report any suspicious email by clicking the "fish" button in Outlook. Thank you! ST Information Security

The following are comments regarding the proposed location of the Sound Transit OMF South Facility at the current location of a major church (Christian Faith) and school in Federal Way:

1. I recall that the down selection process for site location for this facility was interesting. One location was removed from consideration due to a Dick's Burgers being on the site. It's interesting how priorities (burgers over religion and education) and politics determine the location of infrastructure in this county/state.
2. The site with the least impact on **people** and the **environment** is the Midway Landfill site (full excavation option). The only logical and sensible solution for that land is to finally clean it up and use it for a practical purpose, such as OMF South. King County and /or the state of Washington should share in covering the cost of the cleanup of the site, then Sound Transit should build the facility on the cleaned up land after removal of the contaminated soil. There would be no displacement of churches, businesses, burger restaurants, schools, or impact to a sensitive environmental area (eg stream impacts, wetland impact or forest impact) (page ES-24 in the executive summary)
3. The cities of Federal Way, Kent and Des Moines have provided input that the Midway landfill site is the best location for OMF South. Please listen to their input.
4. The proposed site at the Christian Faith Center property would impact the Hylebos Creek and wetlands, without proper mitigation. The Washington State Tribes have pointed out that much money has been spent on this property for habitat restoration, containment , cleanup and stream enhancements located downstream below the 336th-344th sites. Pipelines and underground drainage offer no means of water treatment or groundwater recharge and are viewed as incompatible with fish recovery. Any further loss of water treatment opportunities and recharge are not an acceptable option for the tribes.
5. The Midway landfill site will not incur any real estate costs (which don't appear to be in the S. 336th st alternative estimate)

The Midway Landfill site is the obvious location for OMF South.

Thanks for your time.
Robert (Bob) Strong
Federal Way resident since 1981

Bob Strong (Communication ID 539034)		
Comment ID	**Comment Text**	**Response**
1	1. The cost estimates of the 3 options aren't that much different, especially when considering impact to people, streams, environment. The Midway/Kent option would take longer (perhaps) but impact the least people--- is the schedule really that important, given the delays already encountered?	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	2. What is the input from the Federal Way City Council and mayor?	The city of Federal Way submitted comment letters on both the 2021 SEPA Draft EIS and the 2023 NEPA Draft/SEPA Supplemental Draft EIS. See their comments and Sound Transit's responses in Appendix L1 above and in this appendix, L2.

Vickie Chynoweth

“Hello, my name is Vickie Chynoweth, and I guess I think about people more than I do about money. I think that the Midway Landfill would be the best alternative even though it's your lowest alternative here. When you start looking at the displacement for residential impact, it's zero on the Midway Landfill. If you look at the business displacement, there's only four, the community and social resource impacts, zero, estimated employee displacement, 43.You look at the other two, and it's all here. I don't need to read it, but this light rail system has been set back, set back, set back, and now you're saying it will take seven to eight years for us to build on the Midway Landfill. Well, let's get started now because it's been we were supposed to be done with Federal Way light rail in 2023. Then it was 2024. Then it was 2025. If we start now with the Midway Landfill, you could probably be done in seven or eight years, and we might be done with the Federal Way light rail. We're not going to be moving onto 356th or Tacoma for several years, so there's no need for the rush to displace all of these lives and businesses. Thank you.”

Vickie Chynoweth (Communications ID 539042)

Michael Hoag

“Good evening, my name is Michael Hoag. I'm a Federal Way resident, and my biggest concern with the Midway Landfill is the uncertainties around everything I've read or heard about that, that we just don't know how much that's going to cost over time and how long it will take because of those costs over time.

I'm a big fan of really Option 1. I think that seems to have the most credence to me. Given the people who will have to be moved, that's part of really getting moving forward with this big project that we've been working on now for however many years and many years ahead of us still, so I'm a fan of Option 1.

I think that that makes a lot of sense, and I'm really looking forward to having the benefits of all the jobs of a maintenance facility supporting our community. Thank you.”

Michael Hog (Communications ID 539043)

2	I'm a big fan of really Option 1. I think that seems to have the most credence to me. Given the people who will have to be moved, that's part of really getting moving forward with this big project that we've been working on now for however many years and many years ahead of us still, so I'm a fan of Option 1. I think that that makes a lot of sense, and I'm really looking forward to having the benefits of all the jobs of a maintenance facility supporting our community. Thank you.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.

Bill Pugnetti

“Hello, Bill Pugnetti, Auburn, Washington, and I certainly agree with the first commenter. That's very good. I'm looking at your figures you had for the residential and business displacements in the preferred location in South 344th. Residential on the preferred show a figure of 15, and on 344th you show a figure of 20. Now, 344th includes Garage Town, and what you're not reflecting in your figures is that Garage Town is an extension of households. Those are garages and not all, but many of the folks have an extension of their home there. They park their motorhome, their boat, extra cars, storage of just family items that they can't accommodate at home and a mix of those, hobby equipment, whatever it is.You do not reflect the impact that that is having on households by giving a figure of 20. It's not where they live, but it's their household operation, their lifestyle, and their planning to do appropriately. Also, there's our businesses in Garage Town. You don't reflect the impact on those businesses. An ice cream company has three to five locations in there, and I know the restaurant in Tacoma, they work out of there with their supplies and extra furniture. Your figures are lacking in the impact on households and businesses for South 344th. They do not reflect real impact.”

Karen Brugato

“My name is Karen Brugato. I wanted to comment about the Midway Landfill. It was a logical choice for me. Down in Federal Way, we don't get just one. We get two light rail stations, and we get the OMF. That's three big chunks of land. I noticed Bellevue only has one station and a 25 acre OMF. Down in the central part of Seattle they have an OMF. It's 25 acres. The one in Federal Way is 66 acres. How can something be over twice as big? Maybe we should be called Sound Transit Way instead of Federal Way. I'm not quite sure, but if you notice, our representative on the Sound Transit board, Pete von Reichbauer, voted that it should be the OMF should be at the Midway Landfill. I think it should be there too. Please don't let money stand in the way. Don't let time stand in the way. In this day and age, grants are available. The administration is up for new things. Please have it be at the Midway Landfill for the OMF, thanks.”

1	I wanted to comment about the Midway Landfill. It was a logical choice for me	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	Down in Federal Way, we don't get just one. We get two light rail stations, and we get the OMF. That's three big chunks of land. I noticed Bellevue only has one station and a 25 acre OMF. Down in the central part of Seattle they have an OMF. It's 25 acres. The one in Federal Way is 66 acres. How can something be over twice as big? Maybe we should be called Sound Transit Way instead of Federal Way.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS. In Bellevue, OMF East is approximately 28 acres, and there are six stations. In Seattle, OMF Central is approximately 25 acres. As described in Chapter 2, Alternatives Considered, OMF South needs to be at least 59 acres to accommodate the functions of the facility.
3	I'm not quite sure, but if you notice, our representative on the Sound Transit board, Pete von Reichbauer, voted that it should be the OMF should be at the Midway Landfill. I think it should be there too. Please don't let money stand in the way. Don't let time stand in the way. In this day and age, grants are available. The administration is up for new things. Please have it be at the Midway Landfill for the OMF, thanks.	Please see the response to Common Comments 4 and 5 in Table L.1-1, Responses to Common Comments, in the Final EIS.

Suzanne Vargo

“Lots of things to say. I'm quite concerned with the fact that this site was brought up late in the game. They've been working on this since 2015 of where your OMF would go, and this site was never considered. I do believe it is a conflict of interest with Mr. Pete von Reichbauer, who presented this to Sound Transit. He is on the board, and he is personal friends with the owner of the church, so that seems rather convenient, and the timing was rather interesting. The citizens of Federal Way fought for four years for environmental protections and mitigations when the church was built, and I just don't understand how we are able to go back and take that same 20 percent 20 years later. That's not usually something that is done. The land belongs with a concomitant agreement that runs forever along with the Weyerhaeuser campus. There are recreational restrictions. There is storm water management restrictions and requirements and a few others that need to be considered. I am concerned about the petroleum pipeline that runs along South 336th. It was one of the reasons we were able to stop a toxic fish warehouse on the campus because of the heavy loads traversing over that road, so that is a great concern of when we were hauling. I'm a huge advocate for the Hylebos watershed, and it is my belief that the east branch, which actually feeds two watersheds, the Green River and the Hylebos, will be extinguished. You got comments from the Tribe. That's just a few of the things I'm concerned about. You've already bulldozed the land and done great harm at this point. Thank you so much.”

Suzanne Vargo (Communications ID 539046)

He is on the board, and he is personal friends with the owner of the church, so that seems rather convenient, and the timing was rather interesting.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS. The South 336th Street Alternative (Preferred Alternative) was identified during the 2018 OMF South early scoping process. After an alternatives screening process and public and agency comments, in May 2019 the Sound Transit Board identified the South 336th Street Alternative for study in the Draft EIS, along with the South 344th Street Alternative and the Midway Landfill Alternative.
2	The citizens of Federal Way fought for four years for environmental protections and mitigations when the church was built, and I just don't understand how we are able to go back and take that same 20 percent 20 years later. Please see the response to Common Comment 3 in Table L.1-1, Responses to Common Comments, in the Final EIS. A segment of the tributary to the East Fork Hylebos would be daylighted by the project under the Preferred Alternative. Final EIS Section 3.10, Ecosystem Resources, and Appendix G3, Ecosystems Resources Technical Report, further detail the impacts and avoidance, minimization, and mitigation measures concerning Hylebos Creek. Temporary impacts have occurred along the stream and buffer related to geotechnical borings. All appropriate permits and approvals were secured in advance of geotechnical investigations and temporarily disturbed soils have been restored.

Francine Martin

“Hello, my name is Francine Martin. I am not a resident of any of these areas. My father in law and my mother in law are. They have been residents at Belmor Park for almost 25 years. This Christmas day will be 24 years. I agreed with the first commenter. That was actually a very good statement that it should be the landfill because it's less impact to people like them. Mom is 75. Dad just turned 79. They've been there for, like I said, quite a while. It's their retirement home, and it's just too much of a personal impact for people like this. Actually, our daughter Marielle is with mom right now, and she's been going to that home to spend time with them since her birth. That's all she knows as far as where her grandparents live, and if that landfill is an option that won't disrupt their lives, that is something we definitely agree with.

We'd like for you folks to really consider the things, the place that will not impact families like ours. The Martins have been a stronghold in this community for quite a while, and we'd like to stay that way. Thank you.”

Francine Martin (Communications ID 539047)

William Terrance

I think the preferred alternative is the superior option. The greatest need for the light rail system is expansion, the other options take longer for construction to complete. Not only does construction have a greater impact on the environment it is also difficult to anticipate the necessary closures and needs for different routes for residents in the area.

OMF South NEPA DEIS OOH Comment 19

10/31/2023

Bruce Tecklenburg

If you use one of the two Federal Way sites, you don't need a test track because all of the track from 320th to 344th is not revenue service track. You can use that track as test track. Save the tax payers a couple of bucks and knock the test track off the plan until you actually extend the line and put it into service. You can also use mainline for testing trains. Just use signals and switches or off peak times. Stop wasting money

Bruce Tecklenburg (Communications ID 539054)

Comment ID	Comment Text	Response

Save the tax payers a couple of bucks and knock the test track off the plan until you actually extend the line and put it into service. You can also use mainline for testing trains. Just use signals and switches or off peak times. Stop wasting money	If either the Preferred or South 344th Street alternative is selected as the project to be built, a test track would be necessary. As the commenter notes, the mainline track connecting the OMF South to the FWLE terminus would be used in the morning and night to deploy trains and thus would be unused for most of the day. However, if TDLE is constructed, this length of mainline would become part of the active Link system and would be unavailable for use as a test track. It would be more efficient from a schedule and a cost standpoint to construct the test track at the same time as the mainline. Constructing the test track at the same time as the mainline would also reduce the duration of construction, minimizing impacts to the adjacent land uses.

Communication ID: 539055

OMF South NEPA DEIS OOH Comment 20

10/31/2023

Finn S

I think that they are good alternatives, but I would like to see a bigger OMF that can address capacity issues that we currently see in the future. I would also like to ask if the midway landfill option would be dependent or independent on TDLE, meaning that if there are delays to TDLE that the midway landfill could open up sooner.

Finn S (Communications ID 539055)		
Comment ID	**Comment Text**	**Response**
1	I think that they are good alternatives, but I would like to see a bigger OMF that can address capacity issues that we currently see in the future.	As described in Chapter 2, Alternatives Considered, of the Final EIS, the OMF South has been sized to meet the operational needs of Sound Transit as set out in the Sound Transit 3 Plan.
2	I would also like to ask if the midway landfill option would be dependent or independent on TDLE, meaning that if there are delays to TDLE that the midway landfill could open up sooner.	None of the proposed OMF South build alternatives are dependent on the development of TDLE. As outlined in the Purpose and Need statement for the project in Chapter 1 of the Final EIS, the current regional system lacks a facility with sufficient capacity and suitable location to support the efficient and reliable long-term operations for system-wide Link light rail expansion, including the next phase of expansion in King and Pierce counties.

OMF South NEPA DEIS OOH Comment 21

11/02/2023

Jacob Davidson

Hello, I live at 1830 S. 336th street in Federal way. I have serious concerns about the budling and living next to a OMF directly across the street from my home. I worry about the noise while building and after when it is up and running. I have concerns of the noise affecting quality of life for me and my community. I worry that my homes value will plumet and I think I will have a hard time selling, especially during construction. Looking at the environmental impacts. The preferred site directly across the street from my condo complex will affect 2.7 acres of wetlands, 1500 feet of streams and 11 acres of mature native Forrest. As a native Pacific Northwest resident the rate at which our beautiful evergreen trees are disappearing is alarming. They recently took down several acres of trees to the north of my condos to build 94 townhomes. I can now hear I-5 in my bedroom and I worry that it will get even worse if Sound Transit takes out 11 more acres of Forrest. I work at a local hospital as an monitor tech, I watch patient's hearts and alert nurses of changes and lethal cardiac events. Would you want a person monitoring your heart or a families members heart who can not sleep because of freeway noise and construction noise, not to mention it will be a 24/7 facility. I would move now but everything is so expensive and once the construction is announced I fear I will owe more than I will be able to get for my condo. I understand that the midway station will cost more but what else can be done with that area? To me using the midway landfill is the preferred area and best for the environment. We must try to reduce our carbon footprint and chopping down 11 acres of Forrest, reducing wetlands and affecting a stream will not do our planet any favors. I feel midway is the best option and the name says it all, "mid - way" between Seattle and Tacoma, it uses land otherwise useless and would save 11 acres of trees, homes for animals and a sound / pollution buffer for Interstate 5. Please do not build OMF next to my home. Sincerely, Jacob Davison

Jacob Davidson (Communication ID 539056)		
Comment ID	**Comment Text**	**Response**
1	Hello, I live at 1830 S. 336th street in Federal way. I have serious concerns about the budling and living next to a OMF directly across the street from my home. I worry about the noise while building and after when it is up and running. I have concerns of the noise affecting quality of life for me and my community. I worry that my homes value will plumet and I think I will have a hard time selling, especially during construction.	Please see Final EIS Section 3.9, Noise and Vibration, for a discussion of potential construction and operational impacts and the avoidance, minimization, and mitigation measures to address those impacts.
2	Looking at the environmental impacts. The preferred site directly across the street from my condo complex will affect 2.7 acres of wetlands, 1500 feet of streams and 11 acres of mature native Forrest. As a native Pacific Northwest resident the rate at which our beautiful evergreen trees are disappearing is alarming. They recently took down several acres of trees to the north of my condos to build 94 townhomes.	Please see the response to Common Comment 3 in Table L.1-1, Responses to Common Comments, in the Final EIS.
3	I can now hear I-5 in my bedroom and I worry that it will get even worse if Sound Transit takes out 11 more acres of Forrest. I work at a local hospital as an monitor tech, I watch patient's hearts and alert nurses of changes and lethal cardiac events. Would you want a person monitoring your heart or a families members heart who can not sleep because of freeway noise and construction noise, not to mention it will be a 24/7 facility. I would move now but everything is so expensive and once the construction is announced I fear I will owe more than I will be able to get for my condo.	Please see Final EIS Section 3.9, Noise and Vibration, for a discussion of potential construction and operational impacts. No noise impacts were identified from motor vehicle traffic associated with OMF operations, and noise from LRVs traveling along the mainline would be fully mitigated. Modification of the existing berm and noise walls adjacent to I-5 would result in traffic noise impacts at about one to three residences in Belmor. Sound Transit would provide traffic noise mitigation measures where traffic noise levels are predicted to be above the 2042 No-Build levels from removal of the existing berm and noise wall.
4	I understand that the midway station will cost more but what else can be done with that area? To me using the midway landfill is the preferred area and best for the environment. We must try to reduce our carbon footprint and chopping down 11 acres of Forrest, reducing wetlands and affecting a stream will not do our planet any favors. OMF South NEPA DEIS OOH Comment 22

11/06/2023

Lani Akers

I am writing to you today in full opposition to both potential OMF sites (S. 336th St. & S. 344th St.) here in the city of Federal Way. The Puyallup Tribe has emphatically stated that pipelines and underground drainage conveyances offer NO means of water treatment or ground water recharge whatsoever and therefore are viewed as incompatible with fish recovery. Regardless of whether fish travel up to this area, it is the microbenthic vertebrae (food) that must travel via rocks, trees, and water to reach the lower reaches of the Hylebos East branch that must sustain healthy salmonoids. The tribes have spent tens of millions of dollars on property acquisitions, restoration plans, habitat restoration, stream enhancements and contaminant cleanup sites on lands that sit below the S. 336th St. and S. 344th St. sites. Loss of water treatment opportunities and recharge are NOT an acceptable option for the tribe. As stewards of these lands since time memorial, I support the Puyallup Tribes Sovereignty for preservation. We are a small city of only 22 Square miles. Sound Transit has recently taken over and built their transit light rail station at our cities core at S. 320th. Expected build out of another transit transfer station and parking garage is planned for our south end, resulting in more considerable business and traffic impacts. Now the citizens of Federal Way are expected to sacrifice not one but two possible locations in our midtown. It is outrageous to expect that our city is to accommodate all of Sound Transits needs, especially one that is industrialized and goes against city developmental policies. These two sites were studied by Sound Transit as having a higher percentage of low-income and minority persons than the Sound Transit service district and King County. Displacement of housing, community facilities, daycares would further exploit our community members and fortify their economic struggle. To assume that an industrial build such as the proposed 67-acre OMF facility would offset the impacts to the minority population because they would benefit from riding the train is absurd. They would still have to travel outside of their area to utilize a transfer station. Causing them time and money. There are current bus line options already in place. There simply is no M2 or M3 (heavy industries that generate noise, traffic, or pollutants) zoning here in the city of Federal Way. This unseeming and inconsistent development would have devastating/catastrophic effects on businesses like Ellanos Yogurt, N.W. Equipment Sales/Rentals, Garage Town, Voice of Hope Church, Family Life Community Church, Christian Faith Church and associated schools, Redwood Church of God, and Tabernacle Temple of Praise Church. Assumptions are being made by Sound Transit that our city's Comprehensive Plan policies of converting our only light industrial zone in Federal Way (S. 344th St.), vacating public roads and modifications of development standards will be permitted. There is a distinction between "working with the city" and expecting the city to disregard their policies. The Transportation Technical report needs to be corrected and clarified on numerous issues. This includes eliminating 20th Ave. S., as this is the only access for emergency vehicles. Any delay in response time can have serious negative health impacts to our community members. The suggested solution to bulldoze a road through a critical wetland is also not an acceptable option. Mitigations took place in 1994, our water district operates within this area, it serves as an aquifer recharge area and is home to numerous wildlife species. The S. 336th St. option runs with a never-ending Concomitant Agreement, that is not negotiable, and as Christian Faith owners stated in their 2021 letter, "we have commitments to stormwater management, site access, mitigation, and recreational areas." A reminder that this land is a part of the iconic Weyerhaeuser Campus, in which visual impacts were NOT adequately addressed in previous Draft statements. The Christian Faith land WAS already mitigated in 1994 and it was the citizens who fought for four long years to preserve the functionality of the Hylebos Creek, surrounding tributaries and wetlands. It should not be allowed to be mitigated again. This is a Corporate Park zoning with highly sensitive areas, that do not warrant a Heavy Industrial Equipment zoning. Noise and vibration impacts will be considerably undesirable and unhealthy for residents and wildlife. The open spaces, creek and native forests provide food, water, and shelter as it is a part of the International Flight Pathway. 150 migrating species depend on these resources. Sound Transit, King County and the city of Federal Way must consider the cumulative impacts of future developments within the Hylebos Watershed. Hylebos Watershed and Lower Puget Sound Plan must be included and thoughtfully considered. Numerous large developments such as the two warehouses built recently on the Weyerhaeuser Campus has already negated portions of the East Branch of the Hylebos, a head water tributary, that fed not only the Hylebos, but the Duwamish/Green River Watersheds. Any further demolition of the Hylebos East Branch Creek will surely lead to its demise. The cities of Kent, Des Moines and Auburn are in favor of the Midway landfill as The Preferred OMF site. They stand in opposition with the city of Federal Way for the construction of the OMFSouth at either of these locations. The landfill is a most doable site. if the Federal government or the state would be invited to assist in the funding, according to public conversations posted, between Sound Transit planners and engineers. Sound Transit should exhaust every available option before it forever displaces our citizens, businesses, environment, aquifer, and high quality of life here in Federal Way. I urge Sound Transit to reconsider the two previous site options in Fife, as the zoning would permit a heavy industrial equipment build. These two options were dismissed to quickly, due to a lag of a mere 22 seconds in train journey travel in regards to reaching its set destinations. Surely this can be managed by the experts of Sound Transit, and should be a priority task moving forward. Respectfully submitted by ¦Lani Akers resident[redacted]

Expected build out of another transit transfer station and parking garage is planned for our south end, resulting in more considerable business and traffic impacts. Now the citizens of Federal Way are expected to sacrifice not one but two possible locations in our midtown. It is outrageous to expect that our city is to accommodate all of Sound Transits needs, especially one that is industrialized and goes against city developmental policies.	Please see the response to Kerry Lesinski (Communications ID 539016) comment 3.
4	These two sites were studied by Sound Transit as having a higher percentage of low-income and minority persons than the Sound Transit service district and King County. Displacement of housing, community facilities, daycares would further exploit our community members and fortify their economic struggle. To assume that an industrial build such as the proposed 67-acre OMF facility would offset the impacts to the minority population because they would benefit from riding the train is absurd. They would still have to travel outside of their area to utilize a transfer station. Causing them time and money. There are current bus line options already in place.	Please see the response to Kerry Lesinski (Communications ID 539016) comment 4..

5	There simply is no M2 or M3 (heavy industries that generate noise, traffic, or pollutants) zoning here in the city of Federal Way. This unseeming and inconsistent development would have devastating/catastrophic effects on businesses like Ellanos Yogurt, N.W. Equipment Sales/Rentals, Garage Town, Voice of Hope Church, Family Life Community Church, Christian Faith Church and associated schools, Redwood Church of God, and Tabernacle Temple of Praise Church. Assumptions are being made by Sound Transit that our city's Comprehensive Plan policies of converting our only light industrial zone in Federal Way (S. 344th St.), vacating public roads and modifications of development standards will be permitted. There is a distinction between "working with the city" and expecting the city to disregard their policies.	Please see the response to Kerry Lesinski (Communications ID 539016) comment 5.
6	The Transportation Technical report needs to be corrected and clarified on numerous issues. This includes eliminating 20th Ave. S., as this is the only access for emergency vehicles. Any delay in response time can have serious negative health impacts to our community members.	Please see the response to Kerry Lesinski (Communications ID 539016) comment 6.
7	The suggested solution to bulldoze a road through a critical wetland is also not an acceptable option. Mitigations took place in 1994, our water district operates within this area, it serves as an aquifer recharge area and is home to numerous wildlife species. The S. 336th St. option runs with a never-ending Concomitant Agreement, that is not negotiable, and as Christian Faith owners stated in their 2021 letter, "we have commitments to stormwater management, site access, mitigation, and recreational areas." A reminder that this land is a part of the iconic Weyerhaeuser Campus, in which visual impacts were NOT adequately addressed in previous Draft statements. The Christian Faith land WAS already mitigated in 1994 and it was the citizens who fought for four long years to preserve the functionality of the Hylebos Creek, surrounding tributaries and wetlands. It should not be allowed to be mitigated again. This is a Corporate Park zoning with highly sensitive areas, that do not warrant a Heavy Industrial Equipment zoning. Noise and vibration impacts will be considerably undesirable and unhealthy for residents and wildlife. The open spaces, creek and native forests provide food, water, and shelter as it is a part of the International Flight Pathway. 150 migrating species depend on these resources.	Please see the response to Kerry Lesinski (Communications ID 539016) comment 7.

Lani Akers (Communication ID 539057)		
Comment ID	**Comment Text**	**Response**
8	Sound Transit, King County and the city of Federal Way must consider the cumulative impacts of future developments within the Hylebos Watershed. Hylebos Watershed and Lower Puget Sound Plan must be included and thoughtfully considered. Numerous large developments such as the two warehouses built recently on the Weyerhaeuser Campus has already negated portions of the East Branch of the Hylebos, a head water tributary, that fed not only the Hylebos, but the Duwamish/Green River Watersheds. Any further demolition of the Hylebos East Branch Creek will surely lead to its demise.	Please see the response to Kerry Lesinski (Communications ID 539016) comment 8.
9	The cities of Kent, Des Moines and Auburn are in favor of the Midway landfill as The Preferred OMF site. They stand in opposition with the city of Federal Way for the construction of the OMF South at either of these locations. The landfill is a most doable site. if the Federal government or the state would be invited to assist in the funding, according to public conversations posted, between Sound Transit planners and engineers. Sound Transit should exhaust every available option before it forever displaces our citizens, businesses, environment, aquifer, and high quality of life here in Federal Way.	Please see the response to Kerry Lesinski (Communications ID 539016) comment 9.
10	I urge Sound Transit to reconsider the two previous site options in Fife, as the zoning would permit a heavy industrial equipment build. These two options were dismissed to quickly, due to a lag of a mere 22 seconds in train journey travel in regards to reaching its set destinations. Surely this can be managed by the experts of Sound Transit, and should be a priority task moving forward.	Please see the response to Kerry Lesinski (Communications ID 539016) comment 10.

November 6, 2023

To: OMF South @ Erin Green

Sound Transit

401 Jackson Street

Seattle, WA 98104

I am writing to you today in full opposition to both potential OMF sites (S. 336th St. & S. 344th St.) here in the city of Federal Way.

The Puyallup Tribe has emphatically stated that pipelines and underground drainage conveyances offer NO means of water treatment or ground water recharge whatsoever and therefore are viewed as incompatible with fish recovery. Regardless of whether fish travel up to this area, it is the microbenthic vertebrae (food) that must travel via rocks, trees, and water to reach the lower reaches of the Hylebos East branch that must sustain healthy salmonoids. The tribes have spent tens of millions of dollars on property acquisitions, restoration plans, habitat restoration, stream enhancements and contaminant cleanup sites on lands that sit below the S. 336th St. and S. 344th St. sites. Loss of water treatment opportunities and recharge are NOT an acceptable option for the tribe. As stewards of these lands since time memorial, I support the Puyallup Tribes Sovereignty for preservation.

We are a small city of only 22 Square miles. Sound Transit has recently taken over and built their transit light rail station at our cities core at S. 320th. Expected build out of another transit transfer station and parking garage is planned for our south end (location to be determined) resulting in more considerable business and traffic impacts. Now the citizens of Federal Way are expected to sacrifice not one but two possible locations in our midtown. It is unacceptable to expect that our city is to accommodate all of Sound Transits needs.

These two sites were studied by Sound Transit as having a higher percentage of low-income and minority persons than the Sound Transit service district and King County. Displacement of community facilities, daycares and housing would further exploit and fortify their economic struggle. To assume that an industrial build such as the proposed 67-acre OMF facility would offset the impacts to the minority population because they would benefit from riding the train is absurd. They would still have to travel outside of their area to utilize a transfer station. Causing them time and money. There are sufficient bus line options already in place.

There simply is no M2 or M3 (heavy industries that generate noise, traffic, or pollutants) zoning here in the city of Federal Way. This unseeming and inconsistent development would have devastating/catastrophic effects on businesses like Ellanos Yogurt, N.W. Equipment Sales/Rentals, Garage Town, Voice of Hope Church, Family Life Community Church, Christian Faith Church and associated schools, Redwood Church of God, and Tabernacle Temple of Praise Church.

Assumptions are being made by Sound Transit that our Comprehensive Plan policies of converting our only light industrial zone in Federal Way (S. 344th St.), vacating public roads and modifications of development standards will be permitted. The Transportation Technical report is riddled with needed corrections and clarification, as well as disregarding emergency vehicles the ability to use S. 20th Ave. The suggested solution to bulldoze a road through a critical class 5 wetland is not an acceptable option as our water district operates within this area, serves as an aquifer recharge area and is home to numerous wildlife species.

The S. 336th St. option runs with a never-ending Concomitant Agreement, that is not negotiable, and as Christian Faith owners stated in their 2021 letter, "we have commitments to stormwater management, site access, mitigation, and recreational areas. A reminder that this land is a part of the iconic Weyerhaeuser Campus, in which visual impacts were NOT adequately addressed in previous Draft statements. The Christian Faith land WAS already mitigated in 1994 and it was the citizens who fought for four long years to preserve the functionality of the Hylebos Creek, surrounding tributaries and wetlands. It should not be allowed to be mitigated again. This is a Corporate Park zoning with highly sensitive areas, that do not warrant a Heavy Industrial Equipment zoning. Noise and vibration impacts will be considerably undesirable and unhealthy for residents and wildlife, as the open spaces, creek and native forests provide food, water, and shelter as it is a part of the International Flight Pathway. 150 migrating species depend on these resources.

Sound Transit, King County and the city of Federal Way must consider the cumulative impacts of future developments within the Hyebos Watershed. Hylebos Watershed and Lower Puget Sound Plan must be included and thoughtfully considered. Numerous large developments such as the two warehouses built recently on the Weyerhaeuser Campus has already negated a head water tributary, that fed not only the Hylebos, but the Duwamish/Green River Watersheds. Any further demolition of the Hylebos East Branch Creek will surely lead to its demise.

The cities of Kent, Des Moines and Auburn are in favor of the Midway landfill as **The Preferred** OMF site. They stand in opposition with the city of Federal Way for the construction of the OMFSouth at either of these locations. The landfill is a most doable site, if the Federal government or the state would be invited to assist in the funding. Sound Transit should exhaust every available option before it forever displaces our citizens, businesses, environment, aquifer, and high quality of life here in Federal Way.

The Executive Summary consistently refers to the S. 336th Site as THE PREFERRED site which feels like a deliberate attempt to persuade the reader/voting public. I do not feel this is a fair representation of the three options before us.

I urge Sound Transit to reconsider the two previous site options in Fife, as the zoning would permit a heavy industrial equipment build. These two options were dismissed to quickly, due to a lag of a mere 22 seconds in train journey travel in regards to reaching its set destinations. Surely this can be managed by the experts of Sound Transit, and should be a priority task moving forward.

Sound Transit

401 Jackson Street

Seattle, WA 98104

I am writing to you today in full opposition to both potential OMF sites (S. 336th St. & S. 344th St.) here in the city of Federal Way.

The Puyallup Tribe has emphatically stated that pipelines and underground drainage conveyances offer NO means of water treatment or ground water recharge whatsoever and therefore are viewed as incompatible with fish recovery. Regardless of whether fish travel up to this area, it is the microbenthic vertebrae (food) that must travel via rocks, trees, and water to reach the lower reaches of the Hylebos East branch that must sustain healthy salmonoids. The tribes have spent tens of millions of dollars on property acquisitions, restoration plans, habitat restoration, stream enhancements and contaminant cleanup sites on lands that sit below the S. 336th St. and S. 344th St. sites. Loss of water treatment opportunities and recharge are NOT an acceptable option for the tribe. As stewards of these lands since time memorial, I support the Puyallup Tribes Sovereignty for preservation.

We are a small city of only 22 Square miles. Sound Transit has recently taken over and built their transit light rail station at our cities core at S. 320th. Expected build out of another transit transfer station and parking garage is planned for our south end (location to be determined) resulting in more considerable business and traffic impacts. Now the citizens of Federal Way are expected to sacrifice not one but two possible locations in our midtown. It is unacceptable to expect that our city is to accommodate all of Sound Transits needs.

These two sites were studied by Sound Transit as having a higher percentage of low-income and minority persons than the Sound Transit service district and King County. Displacement of community facilities, daycares and housing would further exploit and fortify their economic struggle. To assume that an industrial build such as the proposed 67-acre OMF facility would offset the impacts to the minority population because they would benefit from riding the train is absurd. They would still have to travel outside of their area to utilize a transfer station. Causing them time and money. There are sufficient bus line options already in place.

There simply is no M2 or M3 (heavy industries that generate noise, traffic, or pollutants) zoning here in the city of Federal Way. This unseeming and inconsistent development would have devastating/catastrophic effects on businesses like Ellanos Yogurt, N.W. Equipment Sales/Rentals, Garage Town, Voice of Hope Church, Family Life Community Church, Christian Faith Church and associated schools, Redwood Church of God, and Tabernacle Temple of Praise Church.

Assumptions are being made by Sound Transit that our Comprehensive Plan policies of converting our only light industrial zone in Federal Way (S. 344th St.), vacating public roads and modifications of development standards will be permitted. The Transportation Technical report is riddled with needed corrections and clarification, as well as disregarding emergency vehicles the ability to use S. 20th Ave. The suggested solution to bulldoze a road through a critical class 5 wetland is not an acceptable option as our water district operates within this area, serves as an aquifer recharge area and is home to numerous wildlife species.

The S. 336th St. option runs with a never-ending Concomitant Agreement, that is not negotiable, and as Christian Faith owners stated in their 2021 letter, "we have commitments to stormwater management, site access, mitigation, and recreational areas. A reminder that this land is a part of the iconic Weyerhaeuser Campus, in which visual impacts were NOT adequately addressed in previous Draft statements. The Christian Faith land WAS already mitigated in 1994 and it was the citizens who fought for four long years to preserve the functionality of the Hylebos Creek, surrounding tributaries and wetlands. It should not be allowed to be mitigated again. This is a Corporate Park zoning with highly sensitive areas, that do not warrant a Heavy Industrial Equipment zoning. Noise and vibration impacts will be considerably undesirable and unhealthy for residents and wildlife, as the open spaces, creek and native forests provide food, water, and shelter as it is a part of the International Flight Pathway. 150 migrating species depend on these resources.

Sound Transit, King County and the city of Federal Way must consider the cumulative impacts of future developments within the Hyebos Watershed. Hylebos Watershed and Lower Puget Sound Plan must be included and thoughtfully considered. Numerous large developments such as the two warehouses built recently on the Weyerhaeuser Campus has already negated a head water tributary, that fed not only the Hylebos, but the Duwamish/Green River Watersheds. Any further demolition of the Hylebos East Branch Creek will surely lead to its demise.

The cities of Kent, Des Moines and Auburn are in favor of the Midway landfill as **The Preferred** OMF site. They stand in opposition with the city of Federal Way for the construction of the OMFSouth at either of these locations. The landfill is a most doable site, if the Federal government or the state would be invited to assist in the funding. Sound Transit should exhaust every available option before it forever displaces our citizens, businesses, environment, aquifer, and high quality of life here in Federal Way.

The Executive Summary consistently refers to the S. 336th Site as THE PREFERRED site which feels like a deliberate attempt to persuade the reader/voting public. I do not feel this is a fair representation of the three options before us.

I urge Sound Transit to reconsider the two previous site options in Fife, as the zoning would permit a heavy industrial equipment build. These two options were dismissed to quickly, due to a lag of a mere 22 seconds in train journey travel in regards to reaching its set destinations. Surely this can be managed by the experts of Sound Transit, and should be a priority task moving forward.

The following are comments regarding the proposed location of the Sound Transit OMF South Facility at the current location of a major church (Christian Faith) and school in Federal Way:

1. I recall that the down selection process for site location for this facility was interesting. One location was removed from consideration due to a Dick’s Burgers being on the site. It’s interesting how priorities (burgers over religion and education) and politics determine the location of infrastructure in this county/state.
2. The site with the least impact on **people** and the **environment** is the Midway Landfill site (full excavation option). The only logical and sensible solution for that land is to finally clean it up and use it for a practical purpose, such as OMF South. King County and /or the state of Washington should share in covering the cost of the cleanup of the site, then Sound Transit should build the facility on the cleaned up land after removal of the contaminated soil. There would be no displacement of churches, businesses, burger restaurants, schools, or impact to a sensitive environmental area (eg stream impacts, wetland impact or forest impact) (page ES-24 in the executive summary)
3. The cities of Federal Way, Kent and Des Moines have provided input that the Midway landfill site is the best location for OMF South. Please listen to their input.
4. The proposed site at the Christian Faith Center property would impact the Hylebos Creek and wetlands, without proper mitigation. The Washington State Tribes have pointed out that much money has been spent on this property for habitat restoration, containment , cleanup and stream enhancements located downstream below the 336th-344th sites. Pipelines and underground drainage offer no means of water treatment or groundwater recharge and are viewed as incompatible with fish recovery. Any further loss of water treatment opportunities and recharge are not an acceptable option for the tribes.
5. The Midway landfill site will not incur any real estate costs (which don’t appear to be in the S. 336th st alternative estimate)

The Midway Landfill site is the obvious location for OMF South.

Thanks for your time.
Robert (Bob) Strong
Federal Way resident since 1981

1	The following are comments regarding the proposed location of the Sound Transit OMF South Facility at the current location of a major church (Christian Faith) and school in Federal Way: I recall that the down selection process for site location for this facility was interesting. One location was removed from consideration due to a Dick's Burgers being on the site. It's interesting how priorities (burgers over religion and education) and politics determine the location of infrastructure in this county/state. The site with the least impact on people and the environment is the Midway Landfill site (full excavation option). The only logical and sensible solution for that land is to finally clean it up and use it for a practical purpose, such as OMF South. King County and /or the state of Washington should share in covering the cost of the cleanup of the site, then Sound Transit should build the facility on the cleaned up land after removal of the contaminated soil. There would be no displacement of churches, businesses, burger restaurants, schools, or impact to a sensitive environmental area (eg stream impacts, wetland impact or forest impact) (page ES-24 in the executive summary) The cities of Federal Way, Kent and Des Moines have provided input that the Midway landfill site is the best location for OMF South. Please listen to their input.	The alternatives development process for the project is described in Section 2.2 of Chapter 2, Alternatives Development and Scoping, of the Final EIS. Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	The proposed site at the Christian Faith Center property would impact the Hylebos Creek and wetlands, without proper mitigation. The Washington State Tribes have pointed out that much money has been spent on this property for habitat restoration, containment, cleanup and stream enhancements located downstream below the 336th-344th sites. Pipelines and underground drainage offer no means of water treatment or groundwater recharge and are viewed as incompatible with fish recovery. Any further loss of water treatment opportunities and recharge are not an acceptable option for the tribes.	Please see the response to Common Comment 3 in Table L.1-1, Responses to Common Comments, in the Final EIS.
3	The Midway landfill site will not incur any real estate costs (which don't appear to be in the S. 336th st alternative estimate) The Midway Landfill site is the obvious location for OMF South.	The majority of the Midway Landfill Alternative site is owned by the City of Seattle. If selected as the project to be built, Sound Transit would lease the property from the city. Table 2.5-1, Opinion of Probable Cost for Preliminary Engineering Design of the Build Alternatives, in the Final EIS lists estimated real estate and relocation costs for each alternative.

RE: OPPOSITION LETTER, due 11/6/2023

I am writing to you today in full opposition to both potential OMF sites (S. 336th St. & S. 344th St.) here in the City of Federal Way.

The Puyallup Tribe has emphatically stated that pipelines and underground drainage conveyances offer NO means of water treatment or ground water recharge whatsoever and therefore are viewed as incompatible with fish recovery. Regardless of whether fish travel up to this area, it is the microbenthic invertebrates that must travel via rocks, trees, and water to reach the lower reaches of the Hylebos East branch that must sustain healthy salmonids. The tribes have spent tens of millions of dollars on property acquisitions, restoration plans, habitat restoration, stream enhancements and contaminant cleanup sites on lands that sit below the S. 336th St. and S. 344th St. sites. Loss of water treatment opportunities and recharge are NOT an acceptable option for the tribe. As stewards of these lands since time memorial, I support the Puyallup Tribes Sovereignty for preservation.

We are a small city of only 22 Square miles. Sound Transit has recently taken over and built their transit light rail station at our city's core at S. 320th. Expected build out of another transit transfer station and parking garage is planned for our south end (location to be determined) resulting in more considerable business and traffic impacts. Now the citizens of Federal Way are expected to sacrifice not one but two possible locations in our midtown. It is unacceptable to expect that our city is to accommodate all of Sound Transit's needs.

These two sites were studied by Sound Transit as having a higher percentage of low-income and minority persons than the Sound Transit service district and King County. Displacement of community facilities, daycares and housing would further exploit and fortify their economic struggle. To assume that an industrial build such as the proposed 67-acre OMF facility would offset the impacts to the minority population because they would benefit from riding the train is absurd. They would still have to travel outside of their area to utilize a transfer station. Causing them time and money. There are sufficient bus line options already in place.

There simply is no M2 or M3 (heavy industries that generate noise, traffic, or pollutants) zoning here in the City of Federal Way. This unseeming and inconsistent development would have devastating/catastrophic effects on businesses like Ellenos Yogurt, N.W. Equipment Sales/Rentals, Garage Town, Voice of Hope Church, Family Life Community Church, Christian Faith Church and associated schools, Redwood Church of God, and Tabernacle Temple of Praise Church.

Assumptions are being made by Sound Transit that our Comprehensive Plan policies of converting our only light industrial zone in Federal Way (S. 344th St.), vacating public roads and modifications of development standards will be permitted. The Transportation Technical report is riddled with needed corrections and clarification, as well as disregarding emergency vehicles the ability to use S. 20th Ave. The suggested solution to bulldoze a road through a critical class 5 wetland is not an acceptable option as our water district operates within this area, serves as an aquifer recharge area and is home to numerous wildlife species.

The S. 336th St. option runs with a never-ending Concomitant Agreement, that is not negotiable, and as Christian Faith owners stated in their 2021 letter, “we have commitments to stormwater management, site access, mitigation, and recreational areas”. A reminder that this land is a part of the iconic Weyerhaeuser Campus, in which visual impacts were NOT adequately addressed in previous Draft statements. The Christian Faith land WAS already mitigated in 1994 and it was the citizens who fought for four long years to preserve the functionality of the Hylebos Creek, surrounding tributaries and wetlands. It should not be allowed to be mitigated again. This is a Corporate Park zoning with highly sensitive areas that do not warrant a Heavy Industrial Equipment zoning. Noise and vibration impacts will be considerably undesirable and unhealthy for residents, domestic animals, and wildlife, as the open spaces, creek and native forests provide food, water, and shelter as it is a part of the International Flight Pathway. 150 migrating species depend on these resources.

Sound Transit, King County and the City of Federal Way must consider the cumulative impacts of future developments within the Hylebos Watershed. Hylebos Watershed and Lower Puget Sound Plan must be included and thoughtfully considered. Numerous large developments such as the two warehouses built recently on the Weyerhaeuser Campus have already negated a head water tributary that fed not only the Hylebos, but the Duwamish/Green River Watersheds. Any further demolition of the Hylebos East Branch Creek will surely lead to its demise.

The Cities of Kent, Des Moines and Auburn are in favor of the Midway landfill as The Preferred OMF site. They stand in opposition with the City of Federal Way for the construction of the OMF South at either of these locations. The landfill is a most doable site if the federal government or the state would be invited to assist in the funding. Sound Transit should exhaust every available option before it forever displaces our citizens, businesses, environment, aquifer, and high quality of life here in Federal Way. The Executive Summary consistently refers to the S. 336th Site as The Preferred site which feels like a deliberate attempt to persuade the reader/voting public. I do not feel this is a fair representation of the three options before us.

I urge Sound Transit to reconsider the two previous site options in Fife, as the zoning would permit a heavy industrial equipment build. These two options were dismissed too quickly, due to a lag of a mere 22 seconds in train journey travel in regard to reaching its set destinations. Surely this can be managed by qualified personnel at Sound Transit, and should be a priority task moving forward.

Sincerely,

Julie Seitz

1	I am writing to you today in full opposition to both potential OMF sites (S. 336th St. & S. 344th St.) here in the City of Federal Way.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	The Puyallup Tribe has emphatically stated that pipelines and underground drainage conveyances offer NO means of water treatment or ground water recharge whatsoever and therefore are viewed as incompatible with fish recovery. Regardless of whether fish travel up to this area, it is the microbenthic invertebrates that must travel via rocks, trees, and water to reach the lower reaches of the Hylebos East branch that must sustain healthy salmonids. The tribes have spent tens of millions of dollars on property acquisitions, restoration plans, habitat restoration, stream enhancements and contaminant cleanup sites on lands that sit below the S. 336th St. and S. 344th St. sites. Loss of water treatment opportunities and recharge are NOT an acceptable option for the tribe. As stewards of these lands since time memorial, I support the Puyallup Tribes Sovereignty for preservation.	Please see the response to Common Comment 3 in Table L.1-1, Responses to Common Comments, in the Final EIS. Final EIS Section 3.10, Ecosystem Resources, and Appendix G3, Ecosystems Resources Technical Report, further detail the impacts and avoidance, minimization, and mitigation measures concerning Hylebos Creek.
3	We are a small city of only 22 Square miles. Sound Transit has recently taken over and built their transit light rail station at our city's core at S. 320th. Expected build out of another transit transfer station and parking garage is planned for our south end (location to be determined) resulting in more considerable business and traffic impacts. Now the citizens of Federal Way are expected to sacrifice not one but two possible locations in our midtown. It is unacceptable to expect that our city is to accommodate all of Sound Transit's needs.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
4	These two sites were studied by Sound Transit as having a higher percentage of low-income and minority persons than the Sound Transit service district and King County. Displacement of community facilities, daycares and housing would further exploit and fortify their economic struggle. To assume that an industrial build such as the proposed 67-acre OMF facility would offset the impacts to the minority population because they would benefit from riding the train is absurd. They would still have to travel outside of their area to utilize a transfer station. Causing them time and money. There are sufficient bus line options already in place.	Sound Transit and FTA have updated Final EIS Appendix E, Environmental Justice Assessment, and Section 3.6, Environmental Justice, Social Resources, Community Facilities, and Neighborhoods, to discuss in greater detail the potential impacts to minority and low-income populations as well as project mitigation and benefits. After consideration of the additional analysis, FTA maintains the preliminary determination that OMF South would not result in disproportionately adverse effects on environmental justice populations.

8	Sound Transit, King County and the City of Federal Way must consider the cumulative impacts of future developments within the Hylebos Watershed. Hylebos Watershed and Lower Puget Sound Plan must be included and thoughtfully considered. Numerous large developments such as the two warehouses built recently on the Weyerhaeuser Campus have already negated a head water tributary that fed not only the Hylebos, but the Duwamish/Green River Watersheds. Any further demolition of the Hylebos East Branch Creek will surely lead to its demise.	Chapter 4, Cumulative Effects Analysis, discusses the potential cumulative impacts to each element of the environment, including ecosystem resources.
9	The Cities of Kent, Des Moines and Auburn are in favor of the Midway landfill as The Preferred OMF site. They stand in opposition with the City of Federal Way for the construction of the OMF South at either of these locations. The landfill is a most doable site if the federal government or the state would be invited to assist in the funding. Sound Transit should exhaust every available option before it forever displaces our citizens, businesses, environment, aquifer, and high quality of life here in Federal Way.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
10	I urge Sound Transit to reconsider the two previous site options in Fife, as the zoning would permit a heavy industrial equipment build. These two options were dismissed too quickly, due to a lag of a mere 22 seconds in train journey travel in regard to reaching its set destinations. Surely this can be managed by qualified personnel at Sound Transit, and should be a priority task moving forward.	The Fife sites were eliminated from further consideration because they are farther than 1.5 miles south of the FWLE terminus and would not be able to efficiently connect to an operating light rail mainline track when OMF South opens. The complete results of the alternatives evaluation are summarized in the OMF South Alternatives Technical Memorandum (Sound Transit 2019c).

OMF concerns

Hello, I live at [redacted] in Federal way. I have serious concerns about the budling and living next to a OMF directly across the street from my home. I worry about the noise while building and after when it is up and running. I have concerns of the noise affecting quality of life for me and my community. I worry that my homes value will plumet and I think I will have a hard time selling, especially during construction. Looking at the environmental impacts. The preferred site directly across the street from my condo complex will affect 2.7 acres of wetlands, 1500 feet of streams and 11 acres of mature native Forrest. As a native Pacific Northwest resident the rate at which our beautiful evergreen trees are disappearing is alarming. They recently took down several acres of trees to the north of my condos to build 94 townhomes. I can now hear I-5 in my bedroom and I worry that it will get even worse if Sound Transit takes out 11 more acres of Forrest. I work at a local hospital as an monitor tech, I watch patient's hearts and alert nurses of changes and lethal cardiac events. Would you want a person monitoring your heart or a families members heart who can not sleep because of freeway noise and construction noise, not to mention it will be a 24/7 facility. I would move now but everything is so expensive and once the construction is announced I fear I will owe more than I will be able to get for my condo. I understand that the midway station will cost more but what else can be done with that area? To me using the midway landfill is the preferred area and best for the environment. We must try to reduce our carbon footprint and chopping down 11 acres of Forrest, reducing wetlands and affecting a stream will not do our planet any favors. I feel midway is the best option and the name says it all, "mid - way" between Seattle and Tacoma, it uses land otherwise useless and would save 11 acres of trees, homes for animals and a sound / pollution buffer for Interstate 5. Please do not build OMF next to my home.
Sincerely,
Jacob Davison

November 4, 2023

OMF South
℅ Elma Borbe, Sr. Environmental Planner
Sound Transit
401 S Jackson Street
Seattle, WA 98104

To Sound Transit,

The GarageTown Federal Way Condominium Association is responsible for maintenance of the GarageTown Federal Way property at 2010 S 344th St in Federal Way. In this capacity we have the following comments on the NEPA Draft/ Supplemental SEPA Draft:

1) The GarageTown Federal Way Condominium Association continues to advocate for the Midway Landfill site, Full Excavation option. The technical and cost issues, clearly summarized in the Draft, are within the capabilities of Sound Transit to overcome, and are worth undertaking to avoid the substantial impact to private property of the other two alternatives.

The Preferred Alternative is the better choice of the remaining alternatives.

The GarageTown Federal Way Condominium Association remains **strongly opposed to the S 344th alternative** - it has the most impact on private property and appears to be the least desirable of the options from a design standpoint.

2) The revised design of the Preferred Alternative indicates an extension of 21st Ave S, connecting S 341st Pl with S344th St.

Preferred Alternative - proposed 21st Ave S extension

The GarageTown Federal Way Condominium Association has a number of concerns about this planned extension:

A. intrusion onto property outside of easement

The existing fence line at the eastern GarageTown Federal Way property border is located approximately 16 feet west of the actual property border, following an easement on the property for future road construction. The GarageTown Federal Way Condominium Association **strongly opposes** incursion onto the property outside of the existing easement. Such incursion would necessarily reduce the width of the eastern driveway of the property. The eastern driveway at its current width is essential for operations to allow for circulation of large vehicles, including tractor-trailers and fire engines. Changing this access pattern would be extremely detrimental to the use of GarageTown Federal by its occupants.

B. fire road access too near the intersection of 21st Ave S and S 344th

The SE corner of the property supports an emergency secondary access to the property for fire equipment. The driveway for this entrance currently terminates at S 344th St, immediately adjacent to the proposed new intersection. This may present a concern to the City of Federal Way in that it would be too close to the proposed intersection as designed.

As an alternative, the intersection could be designed as a curve connecting the two streets, with the fire access in the approximate center of the curve. Such a design would necessarily intrude on the SE corner of the GarageTown Federal Way property corner. This corner is not vital to operations at GarageTown Federal Way, such that the GarageTown Federal Way Condominium is **not opposed** to routing the 21st Ave S extension in a curve over the SE property corner.

A secondary emergency property access gate is located at the NE property corner. Although currently unused, this gate could be re-purposed for an emergency fire entrance if the SE corner entrance is deemed to be unusable from the new street extension. The NE corner is very near the elevation of the existing road to the north, and would require little modification to serve as a secondary emergency entrance. The GarageTown Federal Way Condominium Association is **not opposed** to such a modification, should it become necessary.

Locating other property entrances at the eastern property border is undesirable due to the likely change in elevation from the existing property driveway and the proposed new 21st Ave S extension, which will be several feet below.

C. retention of cul-de-sac - unnecessary and undesirable

The proposed design shows that the cul-de-sac at the eastern terminus of S 344th St would be retained, although redesigned. Such a turn-around would no longer be necessary since vehicles could exit through the new 21st Ave S extension rather than having to execute a u-turn as they do now. In addition, this isolated cul-de-sac is well-known to the Federal Way Police as a site for illicit activity, illegal dumping, and vagrancy. Removing this nuisance would be a net benefit to the area, and the Garage Town Federal Way Condominium Association **strongly advocates** removing this cul-de-sac should the 21st Ave S extension be constructed.

3) Proposed revisions to the path of the east fork of Hylebos Creek in the S 344th St Alternative impose significant risk to the GarageTown Federal Way property. As proposed in Appendix C, page 15, the existing culvert will be replaced with a fish-passable structure.

Preferred Alternative - Hylebos Creek plan

Page G3-81 | Appendix G3: Ecosystem Resources Technical Report

"...the stream would be conveyed under the 21st Avenue S extension and S 344th Street in a new structure that would replace the existing, approximately 315-foot-long culvert. "

The GarageTown Federal Way Condominium Association is **strongly opposed** to this feature. The culvert passes through the GarageTown property near the SE corner of a concrete building. The culvert is buried approximately 15 feet, requiring substantial excavation on the property, imposing risk of damage to the adjacent building through settling or vibration. As an alternative, the creek could be re-routed to the east of the intersection with the new 21st Ave S extension and S 344th St. Such a re-route would remove the requirement to excavate the existing culvert and would benefit the stream hydraulics through additional daylighting of the stream path through the area. This option is suggested in the same appendix as part of the S344th Alternative:

Page G3-83 | Appendix G3: Ecosystem Resources Technical Report

"...approximately 420 linear feet of East Fork Hylebos Tributary immediately north of S 344th Street would be removed from an existing culvert and restored to approximately 570 linear feet of surface-flowing channel. Daylighting this segment would increase the amount of functioning aquatic and riparian habitat available in the stream system."

The GarageTown Federal Condominium Association **strongly advocates** consideration of this design change since it both benefits the stream and removes a substantial risk to the GarageTown Federal Way property.

The GarageTown Federal Way Condominium Association respectfully requests that this information be considered when making decisions regarding the location of OMF South so that the significant impact of those decisions on affected property owners can be properly evaluated.

Sincerely yours,

Edward Miller

President, GarageTown Federal Way Condominium Association

GarageTown Federal Way Condominium Association (Communication ID 539132)		
Comment ID	**Comment Text**	**Response**
1	1. The GarageTown Federal Way Condominium Association continues to advocate for the Midway Landfill site, Full Excavation option. The technical and cost issues, clearly summarized in the Draft, are within the capabilities of Sound Transit to overcome, and are worth undertaking to avoid the substantial impact to private property of the other two alternatives.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	The Preferred Alternative is the better choice of the remaining alternatives.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
3	The GarageTown Federal Way Condominium Association remains strongly opposed to the S 344th alternative - it has the most impact on private property and appears to be the least desirable of the options from a design standpoint.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
4	2. The revised design of the Preferred Alternative indicates an extension of 21st Ave S, connecting S 341st Pl with S344th St. The GarageTown Federal Way Condominium Association has a number of concerns about this planned extension: A. intrusion onto property outside of easement The existing fence line at the eastern GarageTown Federal Way property border is located approximately 16 feet west of the actual property border, following an easement on the property for future road construction. The GarageTown Federal Way Condominium Association strongly opposes incursion onto the property outside of the existing easement. Such incursion would necessarily reduce the width of the eastern driveway of the property. The eastern driveway at its current width is essential for operations to allow for circulation of large vehicles, including tractor/trailers and fire engines. Changing this access pattern would be extremely detrimental to the use of GarageTown Federal by its occupants. B. fire road access too near the intersection of 21st Ave S and S 344th The SE corner of the property supports an emergency secondary access to the property for fire equipment. The driveway for this entrance currently terminates at S 344th St, immediately adjacent to the proposed new intersection. This may present a concern to the City of Federal Way in that it would be too close to the proposed intersection as designed. As an alternative, the intersection could be designed as a curve connecting the two streets, with the fire access in the approximate center of the curve. Such a design would necessarily intrude on the SE corner of the GarageTown Federal Way property corner. This corner is not vital to operations at GarageTown Federal Way, such that the GarageTown Federal Way Condominium is not opposed to routing the 21st Ave S extension in a curve over the SE property corner.	The extension of 21st Avenue S to S 344th Street is proposed to meet City of Federal Way code requirements, which do not allow a cul-de-sac in this location. Sound Transit would continue to work with Federal Way and affected property owners on the design of the 21st Avenue S extension.

Comment ID	**Comment Text**	**Response**
	A secondary emergency property access gate is located at the NE property corner. Although currently unused, this gate could be re-purposed for an emergency fire entrance if the SE corner entrance is deemed to be unusable from the new street extension. The NE corner is very near the elevation of the existing road to the north, and would require little modification to serve as a secondary emergency entrance. The GarageTown Federal Way Condominium Association is not opposed to such a modification, should it become necessary. Locating other property entrances at the eastern property border is undesirable due to the likely change in elevation from the existing property driveway and the proposed new 21st Ave S extension, which will be several feet below. C. retention of cul-de-sac - unnecessary and undesirable The proposed design shows that the cul-de-sac at the eastern terminus of S 544th St would be retained, although redesigned. Such a turn-around would no longer be necessary since vehicles could exit through the new 21st Ave S extension rather than having to execute a U-turn as they do now. In addition, this isolated cul-de-sac is well-known to the Federal Way Police as a site for illicit activity, illegal dumping, and vagrancy. Removing this nuisance would be a net benefit to the area, and the Garage Town Federal Way Condominium Association strongly advocates removing this cul-de-sac should the 21st Ave S extension be constructed.	
5	3. Proposed revisions to the path of the east fork of Hylebos Creek in the S 344th St Alternative impose significant risk to the GarageTown Federal Way property. As proposed in Appendix C, page 15, the existing culvert will be replaced with a fish-passable structure. “ the stream would be conveyed under the 21st Avenue S extension and S 344th Street in a new structure that would replace the existing, approximately 315-foot-long culvert. “ The GarageTown Federal Way Condominium Association is strongly opposed to this feature. The culvert passes through the GarageTown property near the SE corner of a concrete building. The culvert is buried approximately 15 feet, requiring substantial excavation on the property, imposing risk of damage to the adjacent building through settling or vibration. As an alternative, the creek could be re-routed to the east of the intersection with the new 21st Ave S extension and S 344th St. Such a re-route would remove the requirement to excavate the existing culvert and would benefit the stream hydraulics through additional daylighting of the stream path through the area. This option is suggested in the same appendix as part of the S344th Alternative: Page G3-83 | Appendix G3: Ecosystem Resources Technical Report “ approximately 420 linear feet of East Fork Hylebos Tributary immediately north of S 344th Street would be removed from an existing culvert and restored to	FTA and Sound Transit acknowledge the Association's concerns regarding potential property damage associated with removal of the existing culvert. Final design of the replacement fish-passable structure would be done with the goal of avoiding and minimizing alterations to surrounding properties. If the Preferred Alternative is selected as the project to be built, Sound Transit will continue to coordinate with GarageTown on the potential effects to the property as the design advances.

GarageTown Federal Way Condominium Association (Communication ID 539132)

	approximately 570 linear feet of surface-flowing channel. Daylighting this segment would increase the amount of functioning aquatic and riparian habitat available in the stream system." The GarageTown Federal Condominium Association strongly advocates consideration of this design change since it both benefits the stream and removes a substantial risk to the GarageTown Federal Way property.	

OMF SITES ~ FEDERAL WAY

November 6, 2023

To: OMF South @ Erin Green
Sound Transit
401 Jackson Street
Seattle, WA 98104

I am writing to you today in full opposition to both potential OMF sites (S. 336th St. & S. 344th St.) here in the city of Federal Way. The Puyallup Tribe has emphatically stated that pipelines and underground drainage conveyances offer NO means of water treatment or ground water recharge whatsoever and therefore are viewed as incompatible with fish recovery. Regardless of whether fish travel up to this area, it is the microbenthic vertebrae (food) that must travel via rocks, trees, and water to reach the lower reaches of the Hylebos East branch that must sustain healthy salmonoids.

The tribes have spent tens of millions of dollars on property acquisitions, restoration plans, habitat restoration, stream enhancements and contaminant cleanup sites on lands that sit below the S. 336th St. and S. 344th St. sites. Loss of water treatment opportunities and recharge are NOT an acceptable option for the tribe. As stewards of these lands since time memorial, I support the Puyallup Tribes Sovereignty for preservation.

We are a small city of only 22 Square miles. Sound Transit has recently taken over and built their transit light rail station at our cities core at S. 320th. Expected build out of another transit transfer station and parking garage is planned for our south end, resulting in more considerable business and traffic impacts.

Now the citizens of Federal Way are expected to sacrifice not one but two possible locations in our midtown. It is outrageous to expect that our city is to accommodate all of Sound Transits needs, especially one that is industrialized and goes against city developmental policies.

These two sites were studied by Sound Transit as having a higher percentage of low-income and minority persons than the Sound Transit service district and King County. Displacement of housing, community facilities, daycares would further exploit our community members and fortify their economic struggle.

To assume that an industrial build such as the proposed 67-acre OMF facility would offset the impacts to the minority population because they would benefit from riding the train is absurd. They would still have to travel outside of their area to utilize a transfer station. Causing them time and money. There are current bus line options already in place.

There simply is no M2 or M3 (heavy industries that generate noise, traffic, or pollutants) zoning here in the city of Federal Way.

This unseeming and inconsistent development would have devastating/catastrophic effects on businesses like Ellanos Yogurt, N.W. Equipment Sales/Rentals, Garage Town, Voice of Hope Church, Family Life Community Church, Christian Faith Church and associated schools, Redwood Church of God, and Tabernacle Temple of Praise Church.

Assumptions are being made by Sound Transit that our city’s Comprehensive Plan policies of converting our only light industrial zone in Federal Way (S. 344th St.), vacating public roads and modifications of development standards will be permitted.

There is a distinction between “working with the city” and expecting the city to disregard their policies. The Transportation Technical report needs to be corrected and clarified on numerous issues.

This includes eliminating 20th Ave. S., as this is the only access for emergency vehicles. Any delay in response time can have serious negative health impacts to our community members.

The suggested solution to bulldoze a road through a critical wetland is also not an acceptable option. Mitigations took place in 1994, our water district operates within this area, it serves as an aquifer recharge area and is home to numerous wildlife species.

The S. 336th St. option runs with a never-ending Concomitant Agreement, that is not negotiable, and as Christian Faith owners stated in their 2021 letter, "we have commitments to stormwater management, site access, mitigation, and recreational areas." A reminder that this land is a part of the iconic Weyerhaeuser Campus, in which visual impacts were NOT adequately addressed in previous Draft statements. The Christian Faith land WAS already mitigated in 1994 and it was the citizens who fought for four long years to preserve the functionality of the Hylebos Creek, surrounding tributaries and wetlands. It should not be allowed to be mitigated again. This is a Corporate Park zoning with highly sensitive areas, that do not warrant a Heavy Industrial Equipment zoning. Noise and vibration impacts will be considerably undesirable and unhealthy for residents and wildlife. The open spaces, creek and native forests provide food, water, and shelter as it is a part of the International Flight Pathway. 150 migrating species depend on these resources.

Sound Transit, King County and the city of Federal Way must consider the cumulative impacts of future developments within the Hylebos Watershed. Hylebos Watershed and Lower Puget Sound Plan must be included and thoughtfully considered. Numerous large developments such as the two warehouses built recently on the Weyerhaeuser Campus has already negated portions of the East Branch of the Hylebos, a head water tributary, that fed not only the Hylebos, but the Duwamish/Green River Watersheds. Any further demolition of the Hylebos East Branch Creek will surely lead to its demise.

The cities of Kent, Des Moines and Auburn are in favor of the Midway landfill as The Preferred OMF site. They stand in opposition with the city of Federal Way for the construction of the OMFSouth at either of these locations. The landfill is a most doable site. if the Federal government or the state would be invited to assist in the funding, according to public conversations posted, between Sound Transit planners and engineers. Sound Transit should exhaust every available option before it forever displaces our citizens, businesses, environment, aquifer, and high quality of life here in Federal Way.

I urge Sound Transit to reconsider the two previous site options in Fife, as the zoning would permit a heavy industrial equipment build. These two options were dismissed to quickly, due to a lag of a mere 22 seconds in train journey travel in regards to reaching its set destinations. Surely this can be managed by the experts of Sound Transit, and should be a priority task moving forward.

Respectfully submitted,

Roger Flygare
Federal Way Resident

1	I am writing to you today in full opposition to both potential OMF sites (S. 336th St. & S. 344th St.) here in the city of Federal Way.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
2	The Puyallup Tribe has emphatically stated that pipelines and underground drainage conveyances offer NO means of water treatment or ground water recharge whatsoever and therefore are viewed as incompatible with fish recovery. Regardless of whether fish travel up to this area, it is the microbenthic vertebrae (food) that must travel via rocks, trees, and water to reach the lower reaches of the Hylebos East branch that must sustain healthy salmonoids. The tribes have spent tens of millions of dollars on property acquisitions, restoration plans, habitat restoration, stream enhancements and contaminant cleanup sites on lands that sit below the S. 336th St. and S. 344th St. sites. Loss of water treatment opportunities and recharge are NOT an acceptable option for the tribe. As stewards of these lands since time memorial, I support the Puyallup Tribes Sovereignty for preservation.	Please see the response to Common Comment 3 in Table L.1-1, Responses to Common Comments, in the Final EIS. Final EIS Section 3.10, Ecosystem Resources, and Appendix G3, Ecosystems Resources Technical Report, further detail the impacts and avoidance, minimization, and mitigation measures concerning Hylebos Creek.
3	We are a small city of only 22 Square miles. Sound Transit has recently taken over and built their transit light rail station at our cities core at S. 320th. Expected build out of another transit transfer station and parking garage is planned for our south end, resulting in more considerable business and traffic impacts. Now the citizens of Federal Way are expected to sacrifice not one but two possible locations in our midtown. It is outrageous to expect that our city is to accommodate all of Sound Transits needs, especially one that is industrialized and goes against city developmental policies.	Please see the response to Common Comment 4 in Table L.1-1, Responses to Common Comments, in the Final EIS.
4	These two sites were studied by Sound Transit as having a higher percentage of low-income and minority persons than the Sound Transit service district and King County. Displacement of housing, community facilities, daycares would further exploit our community members and fortify their economic struggle. To assume that an industrial build such as the proposed 67-acre OMF facility would offset the impacts to the minority population because they would benefit from riding the train is absurd. They would still have to travel outside of their area to utilize a transfer station. Causing them time and money. There are current bus line options already in place.	Sound Transit and FTA have updated Final EIS Appendix E, Environmental Justice Assessment, and Section 3.6, Environmental Justice, Social Resources, Community Facilities, and Neighborhoods, to discuss in greater detail the potential impacts to minority and low-income populations as well as project mitigation and benefits. After consideration of the additional analysis, FTA maintains the preliminary determination that OMF South would not result in disproportionately adverse effects on environmental justice populations.

5	There simply is no M2 or M3 (heavy industries that generate noise, traffic, or pollutants) zoning here in the city of Federal Way. This unseeming and inconsistent development would have devastating/catastrophic effects on businesses like Ellenos Yogurt, N.W. Equipment Sales/Rentals, Garage Town, Voice of Hope Church, Family Life Community Church, Christian Faith Church and associated schools, Redwood Church of God, and Tabernacle Temple of Praise Church. Assumptions are being made by Sound Transit that our city's Comprehensive Plan policies of converting our only light industrial zone in Federal Way (S. 344th St.), vacating public roads and modifications of development standards will be permitted. There is a distinction between "working with the city" and expecting the city to disregard their policies.	An OMF would not have the same effects as a heavy industrial facility. The potential impacts of OMF South for the topics mentioned in the comment are described in Section 3.2, Transportation, and Section 3.9, Noise and Vibration, of the Final EIS.
6	The Transportation Technical report needs to be corrected and clarified on numerous issues. This includes eliminating 20th Ave. S., as this is the only access for emergency vehicles. Any delay in response time can have serious negative health impacts to our community members.	Appendix G1, Transportation Technical Analysis, and Section 3.2, Transportation, of the Final EIS have been updated to correct errors that were identified in the public comments. Potential impacts to emergency vehicle response times under the Preferred and South 344th Street alternatives are discussed in Section 3.14, Public Services.
7	The suggested solution to bulldoze a road through a critical wetland is also not an acceptable option. Mitigations took place in 1994, our water district operates within this area, it serves as an aquifer recharge area and is home to numerous wildlife species. The S. 336th St. option runs with a never-ending Concomitant Agreement, that is not negotiable, and as Christian Faith owners stated in their 2021 letter, "we have commitments to stormwater management, site access, mitigation, and recreational areas." A reminder that this land is a part of the iconic Weyerhaeuser Campus, in which visual impacts were NOT adequately addressed in previous Draft statements. The Christian Faith land WAS already mitigated in 1994 and it was the citizens who fought for four long years to preserve the functionality of the Hylebos Creek, surrounding tributaries and wetlands. It should not be allowed to be mitigated again. This is a Corporate Park zoning with highly sensitive areas, that do not warrant a Heavy Industrial Equipment zoning. Noise and vibration impacts will be considerably undesirable and unhealthy for residents and wildlife. The open spaces, creek and native forests provide food, water, and shelter as it is a part of the International Flight Pathway. 150 migrating species depend on these resources.	Please see the response to Common Comment 3 in Table L.1-1, Responses to Common Comments, in the Final EIS.
